Instructions for Use
Installation and Servicing

To be left with the user

British Gas
330
G.C. No. 41-047-75
High Efficiency Condensing Boiler

Customer Care Line Tel: 0845 600 5100
www.house.co.uk
The instructions consist of three parts, User, Installation and Servicing Instructions. The instructions are an integral part of the appliance and must, to comply with the current issue of the Gas Safety (Installation and Use) Regulations, be handed to the user on completion of the installation.

**Important Information**

**Gas Category**
The boiler is of the I₂H\textsubscript{m} category for use only with G20 Natural Gas.

**Gas Safety (Installation and Use) Regulations**
In your own interests and that of safety, it is the Law that ALL gas appliances are installed by a competent person in accordance with the current issue of the above regulations.

**Testing and Certification**
The boiler is tested and certificated for safety and performance. It is, therefore, important that no alteration is made to the boiler unless approved, in writing, by British Gas.

Any alteration not approved by British Gas, could invalidate the certification, boiler warranty and may also infringe the current issue of the statutory requirements.

**CE Mark**
This boiler meets the requirements of Statutory Instrument, No. 3083 The Boiler (Efficiency) Regulations, and therefore is deemed to meet the requirements of Directive 92/42/EEC on the efficiency requirements for new hot water boilers fired with liquid or gaseous fuels.

Type test for purposes of Regulation 5 certified by: Notified body 0087.

Product/production certified by: Notified body 0086.

The CE mark on this appliance shows compliance with:

**Control of Substances Hazardous to Health**
Under Section 6 of The Health and Safety at Work Act 1974, we are required to provide information on substances hazardous to health.

The adhesives and sealants used in this appliance are cured and give no known hazard in this state.

**Insulation Pads / Ceramic Fibre**
These can cause irritation to skin, eyes and the respiratory tract. If you have a history of skin complaint you may be susceptible to irritation. High dust levels are usual only if the material is broken.

Normal handling should not cause discomfort, but follow normal good hygiene and wash your hands before eating, drinking or going to the lavatory.

If you do suffer irritation to the eyes or severe irritation to the skin seek medical attention.

**Electrical Supply**
The boiler must be earthed.

All system components shall be of an approved type and all wiring to current I.E.E. wiring regulations.

External wiring must be correctly earthed, polarised and in accordance with the relevant standards.

In GB this is BS 7671.

In IE this is the current edition of I.S.813 "Domestic Gas Installations".

The boiler must be connected to a permanent 230V ac, 50Hz supply.

Connection of the whole electrical system of the boiler, including any heating controls, to the electrical supply must be through one common isolator and must be fused 3 Amp maximum.

Isolation should be by a double pole switched fused spur box, with a minimum gap of 3mm for both poles. The fused spur box should be readily accessible and preferably adjacent to the appliance. It should be identified as to its use.

Alternatively connection can be made through an unswitched shuttered socket and 3A fused 3-pin plug both to the current issue of BS 1363 may be used, provided they are not used in a room containing a bath or shower.

The colours of three core flexible cable are, blue - neutral, brown - live, green and yellow - earth.

**WARNINGS**

**Gas Leak or Fault**
Turn off the gas emergency control valve immediately. Eliminate all sources of ignition, i.e. smoking, blowlamps, hot air guns etc. Do not operate electrical lights or switches either on or off. Open all doors and windows, ventilate the area. Call the British Gas Emergency Service telephone number: 0800 111 999.

**Sheet Metal Parts**
This boiler contains metal parts (components) and care should be taken when handling and cleaning, with particular regard to edges.

**Sealed Components**
Under no circumstances must the User interfere with or adjust sealed parts.
General Information

General Note
This boiler is a wall hung high efficiency condensing boiler, designed to provide central heating from a fully pumped open-vented or sealed water system with a fully indirect cylinder.

Once the controls are set the boiler operates automatically.

Please read these instructions and follow them carefully for the correct installation and economical use of your boiler.

Water Treatment
In the case of an existing installation, it is **ESSENTIAL** that prior to installing the new boiler the system is thoroughly flushed. For optimum performance after installation of a new system, the boiler and its associated central heating system should also be flushed. Flushing should be carried out in accordance with BS7593: 1992 using a cleanser such as Sentinel X300 or X400, Fernox Superfloc or Salamander corrosion guard cleaner.

For long-term corrosion protection, after flushing, an inhibitor suitable for stainless steel exchangers should be used, refer to the current issue of BS 5449 and BS 7593 on the use of inhibitors in central heating systems. Examples are Sentinel X100 Fernox or Salamander corrosion guard inhibitor.

We do not recommend filling using artificially softened water.

Compartment or Cupboard Installations
If the boiler is fitted into a compartment or cupboard it does not require ventilation openings.

Do not use the compartment or cupboard for storage.

Clearances
If fixtures are positioned close to the boiler, space must be left as shown in diagram 2.1. Enough space must also be left in front of the boiler to allow for servicing.

Condensate Drain
The condensate drain, see section 7.3, must not be modified or blocked.

Plumbing from flue terminal
Like all condensing boilers this appliance will produce a plume of condensation from the flue terminal in cool weather. This is due to the high efficiency and hence low flue gas temperature of the boiler. It is normal and not a fault indication.

Cleaning
The boiler casing can be cleaned using a mild liquid detergent with a damp cloth, then a dry cloth to polish.

Do not use any form of abrasive or solvent cleaner as you may damage the paintwork.

Electrical Supply
If the mains electricity and gas are to be turned off for any long periods during severe weather, it is recommended that the whole system, including the boiler, should be drained to avoid the risk of freezing. Make sure that, if fitted, the immersion heater in the cylinder is switched off.

If you have a sealed water system contact your installation/servicing company as draining, refilling and pressurising MUST be carried out by a **competent person**.

Gas Supply
**NOTE:** This appliance is factory set at 18kW output.

On completion of the adjustment, the inlet working pressure of the appliance should be checked to ensure a steady inlet working pressure of 20mbar is achieved.

Thermal Stores
This appliance is suitable for installation with thermal stores, however, the appliance should be adjusted to give the maximum 31kW output.

**IMPORTANT:** If the seal on the ‘Pmax’ potentiometer is broken the gas supply, without exception, must be capable of delivering 31.3kW input.

Manual Handling
**IMPORTANT:** With regards to the Manual Handling Operations, 1992 Regulations, the following lift operation exceeds the recommended weight for a one man lift, refer to Section 14. for more information.
For the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the installation conditions and usage, but in general, once a year should be enough.

If this appliance is installed in a rented property in the UK there is a duty of care imposed on the owner of the property by the current issue of the Gas Safety (Installation and Use) Regulations, Section 35.

Servicing/maintenance should be carried out by a competent person in accordance with the rules in force in the countries of destination.

To obtain service, please contact British Gas’s own service organisation using the telephone number on the front cover of this booklet.

Please be advised that the installation engineer on completion of commissioning and servicing should complete the British Gas logbook.

All CORGI Registered Installers carry a CORGI ID card, and have a registration number. Both should be recorded in your boiler Logbook. You can check your installer is CORGI registered by calling CORGI direct on: - 01256 372300.

The boiler will not work without an electrical supply. Normal operation of the boiler should resume when the electrical supply is restored. Reset any external controls, to resume normal operation of the central heating.

If the boiler does not resume normal operation turn the mains reset switch off and on. If the boiler does not resume normal operation after this the overheating safety device may have operated.

In the event of the boiler overheating the safety devices will cause a safety shutdown. If this happens, call your Installation/Servicing company.

The appliance has a built in frost protection programme as long as the electricity and gas are left switched on. This device operates the burner and system pump when the temperature inside the boiler falls to 3°C. Any other exposed areas of the system should be protected by a separate frost thermostat.

As a safety feature the boiler will stop working if the condensate trap and siphon drain becomes blocked. During freezing conditions this may be due to the forming of ice in the pipe external to the house. Release an ice blockage by the use of warm cloths on the pipe. The boiler should then restart. Contact your installation/servicing company if the fault persists.

When replacing a part on this appliance, use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by British Gas.

If replacement parts are required contact British Gas’s own service organisation using the telephone number on the front cover of this booklet.

Please quote the name of the appliance, this information will be on the name badge on the front of the appliance.

If in doubt seek advice from British Gas’s own service organisation using the telephone number on the inside front cover of this booklet.
Sealed Water Systems

CAUTION. A sealed water system must be filled and pressurised prior to use. Only light the boiler when you are sure that the system and boiler have been filled and pressurised.
The pressure should be at least 0.7 bar, anything less than this figure could indicate a leak and you MUST contact your installer or British Gas’s own Customer Care Line using the telephone number on the front cover of this booklet.

All Systems

Check that the electrical supply to the boiler is ON at the external isolator.
Set any remote controls as required.

Do not operate the boiler without water.
● Slide the mains reset switch to the ON position (I).
The control light will illuminate (green) indicating the boiler is lit, diagram 1.
● The temperature of the central heating water can be adjusted by turning the central heating water temperature control knob to desired setting between ‘Min’ and ‘Max’, diagram 1.
‘Max’ is approximately 82°C (180°F)
The digital display, diagram 1, shows the temperature of the appliance when the appliance is running and in standby.
A fault is indicated by a RED flashing control light and flash fault code on digital display.

To Reset
● Slide the mains reset switch to 0. Wait for 5 seconds.
Slide mains reset switch to I.
If the fault persists contact your installer/service provider.
It should be noted that this is a fan flue appliance and fan operation may be heard.

To Turn the Boiler Off
● There is a mains reset switch on the right hand side of the controls fascia.
However, it is preferable to leave the electrical supply on whenever possible to permit operation of the built-in frost protection and daily pump exercise.
1.1 IMPORTANT NOTICE
The boiler is supplied in one carton, which includes a fittings and documentation pack.

This boiler is for use on Natural Gas (G20) as distributed in the United Kingdom and Ireland and cannot be used on any other gas.

Where no British Standards exists, materials and equipment should be fit for their purpose and of suitable quality and workmanship.

The installation of this boiler must be carried out by a competent person in accordance the rules in force in the countries of destination.

Manufacturer’s instructions must not be taken as overriding statutory requirements.

1.2 Statutory Requirements
The appliance is suitable only for installation in GB and IE and should be installed in accordance with the rules in force.

In GB the installation of the boiler must be carried out by a competent person as described in the following regulations:

- The manufacturer’s instructions supplied.
- The Gas Safety (Installation and Use) Regulations.
- The appropriate Buildings Regulations either The Building Regulations, The Building Regulations (Scotland), The Building Regulations (Northern Ireland).
- The Water Fittings Regulations or Water byelaws in Scotland.
- The Health and Safety at Work Act, Control of Substances Hazardous to Health (COSHH).

In IE, the installation must be carried out by a competent person and installed in accordance with the current edition of I.S.813 "Domestic Gas Installations", the current Building Regulations and reference should be made to the current ETCI rules for Electrical Installation.

In GB the following Codes of Practice apply:

- BS4814, BS6798, BS5440 Part 1 and 2, BS5546 Part 1, BS5449, BS6891, BS6700, BS7074 Part 1 and 2, BS7593.

In IE: I.S.813, BS5446, BS 5449, BS 7074, BS 7593.

Manufacturer’s instructions must not be taken as overriding statutory requirements.

NOTE: For further information, see the current issue of the Building Regulations, approved document L1 (in the UK) and the following current issues of:

1) Central heating system specification (CheSS) and
2) Controls for domestic central heating system and hot water. BRECSU.

Certification
This boiler certificated to the current issue of EN 483 for performance and safety.

It is important that no alteration is made to the boiler, without permission, in writing, from British Gas.

Any alteration that is not approved by British Gas, could invalidate the warranty and could also infringe the current issue of the Statutory Requirements.

Diagram 1.1

* THIS DIMENSION CAN BE INCREASED TO 600 MAX.
1.3 Gas Supply

The gas installation shall be in accordance with the relevant standards.

In GB this is BS6891.

In IE this is the current edition of I.S.813 "Domestic Gas Installations".

The supply from the governed meter must be of adequate size to provide a steady inlet working pressure of 20mbar (8in wg) at the boiler.

On completion, test the gas installation for soundness using the pressure drop method and suitable leak detection fluid, purge in accordance with the above standard.

**NOTE:** This appliance is factory set at 18kW output.

**IMPORTANT:** If the seal on the 'Pmax' potentiometer is broken the gas supply, without exception, must be capable of delivering 31.3kW input.

If this appliance is to be used with a thermal store it should be adjusted to the maximum output and the gas supply must be capable of delivering 31.3kW input.

On completion of the adjustment, the inlet working pressure of the appliance should be checked to ensure a steady inlet working pressure of 20Mbar is achieved.

1.4 Technical Data

All dimensions are given in millimetres (except as noted). See diagram 1.1 and Tables 1 and 2.

The data label is positioned on the inner door, refer to diagram 1.2. The appliance data label must be completed to indicate the maximum output using the rate indicating label provided in the literature pack.

The Seasonal Efficiency Domestic Boilers UK (SEDBUK) is: Class ‘A’.

The value is used in the UK Government’s Standard Assessment Procedure (SAP) for energy rating of dwellings. The test data from which it has been calculated has been certified by Advantica.

1.5 Condensate Drain

A plastic drain pipe must be fitted to allow discharge of condensate to a drain.

Condensate should, if possible, be discharged into the internal household draining system. If this is not practical, discharge can be made externally into the household drainage system or a purpose designed soak away, see Section 7.3 for more details.

Diagram 1.2
2.1 Boiler Location
This boiler is not suitable for outdoor installation.
This boiler may be installed in any room, although particular attention is drawn to the installation of a boiler in a room containing a bath or shower where reference must be made to the relevant requirements.
This boiler is suitable for installation in bathroom zones 2 and 3.
In GB this is the current I.E.E. WIRING REGULATIONS and BUILDING REGULATIONS.
In IE reference should be made to the current edition of I.S.813 “Domestic Gas Installations” and the current ETCI rules.
The boiler must be mounted on a flat wall, which is sufficiently robust to take its total weight, see Table 1. Section 1. Technical Information.

2.2 Clearances
The boiler should be positioned so that at least the minimum operational and servicing clearances are provided, see diagram 2.1.
Additional clearances may be beneficial around the boiler for installation and servicing.
For flue installations where external access is not practicable, consideration should be given for the space required to insert the flue internally, which may necessitate clearance larger than those specified in diagram 2.1.

2.3 Timber Frame Buildings
If the boiler is to be installed in a timber frame building it should be fitted in accordance with the Institute of Gas Engineers document IGE/UP/7/1998 and BG Operational Procedures, Part 19 Building and Kitchen Work, Section 7 - Timber Frame Constructions.

2.4 Room Ventilation
The boiler is room sealed, so when it is installed in a room or space, a permanent air vent is not required.

2.5 Compartment Ventilation
Due to the high efficiency and hence low casing temperature of this boiler, cupboard or compartment ventilation is not necessary.
Leave existing air vents.

† A removable compartment door can be placed at least 5mm in front of the appliance.
3 Flue Location and Ventilation

3.1 Flue Options

This boiler is suitable for concentric Horizontal and Vertical flues, elevated horizontal and vertical twin, all are fitted onto the top of the boiler.

These instructions describe the use of the standard and telescopic horizontal flues.

The instructions for all other flues will be contained in their packs.

3.2 Flue Length

The maximum permissible horizontal flue length is 10 metres plus the flue terminal, this can be achieved by use of the accessories, however should an additional 90° or 2 x 45° elbows be used then the length MUST be reduced by 1 metre.

When extension pipes are used the flue system must be designed to have a continuous fall to the boiler of at least 2.5° 44mm/metre to allow condensate to run back into the boiler and out via the drain.

The flue can be installed from inside the building, when access to the outside wall face is not practicable.

The diagrams 3.1 to 3.4 describe the lengths achievable without the use of extensions or elbows.
3.4 Terminal Position

The minimum acceptable siting dimensions for the terminal from obstructions, other terminals and ventilation openings are shown in diagram 3.5. Dimensions shown are measured from edge of terminal.

Only one dimension from the minimum clearance should be applied, all others should be to the nominal clearance.

The terminal must be exposed to the external air, allowing free passage of air across it at all times.

Being a condensing boiler some plumbing may occur from the flue outlet. This should be taken into consideration when selecting the position for the terminal.

NOTE: If necessary it is permitted to increase the terminal protrusion through the outside wall to greater than the minimum dimension of 87mm but no more than 600mm, see diagram 1.1.

F ‡ and L ‡ See diagram 3.5. Carports or similar extensions of a roof only, or a roof and one wall, require special consideration with respect to any openings, doors, vents or windows under the roof. Care is required to protect the roof if made of plastic sheeting. If the carport comprises of a roof and two or more walls, seek advice from the local gas supply company before installing the boiler.

H * and J * See diagram 3.5. These dimensions comply with the building regulations, but they may need to be increased to avoid wall staining and nuisance from plumbing depending on site conditions.

3.5 Terminal Guard

A terminal guard is required if persons could come into contact with the terminal or the terminal could be subject to damage.

If a terminal guard is required, it must be positioned to provide minimum of 50mm clearance from any part of the terminal and be central over the terminal.

The guard should be plastic coated similar to that shown in diagram 3.6.

A suitable guard is manufactured by:

Tower Flue Components
Morley Rd.
Tonbridge
Kent
TN9 1RA

Size: 280mm x 280mm x 270mm.
4 Water System

4.1 Draining Tap
A draining tap must be provided at the lowest point of the system, which will allow the entire system and hot water system to be drained.

Draining taps shall be to the current issue of BS 2879.

4.2 Safety Valve
A safety valve need not be fitted to an open-vented system.

4.3 Pump
The pump should be fitted on the flow pipe from the boiler and have isolating valves each side.

A variable duty pump should be set to give a temperature difference of no greater than 20°C between the flow and return, with the thermostat set at “MAX”, which is about 80°C, to give a flow rate as shown in table 3.

See chart for pressure loss of the boiler, diagram 4.1.

High resistance microbore systems may require a higher duty pump.

4.4 Flow Rate
If it is necessary to alter the flow rate, the system can be fitted with a lockable balancing valve in the main flow or return pipes shown as valve “A” in diagram 4.3. The flow rate through the boiler must not be allowed to fall below that given in Table 3.

IMPORTANT Flow and Return Pipe Sizes.
Heating circuit flow and return pipes should be sized as follows. Upto 18 kW 22mm. over 18 kW 28mm.

<table>
<thead>
<tr>
<th>OUTPUT</th>
<th>MINIMUM FLOW RATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>18</td>
<td>773.8 litres/hr (12.9litres/min)</td>
</tr>
<tr>
<td>31</td>
<td>1289 litres/hr (21.5litres/min)</td>
</tr>
</tbody>
</table>

This is equal to 20°C differential across the appliance.

4.5 Bypass
A system bypass will be required fitted at least 1.5 metres away from the boiler, refer to the current issue of the central heating system specifications (CHeSS).

4.6 Water Treatment
In the case of an existing installation, it is ESSENTIAL that prior to installing the new boiler the system is thoroughly flushed. For optimum performance after installation of a new system, the boiler and its associated central heating system should also be flushed. Flushing should be carried out in accordance with BS7593: 1992 using a cleanser such as Fernox or Salamander products.

For long-term corrosion protection, after flushing, an inhibitor suitable for stainless steel exchangers should be used, refer to the current issue of BS 5449 and BS 7593 on the use of inhibitors in central heating systems. Examples are Fernox or Salamander products.

4.7 Open (Vented) Water System
The boiler must be supplied from an unrestricted water supply taken from a feed and expansion cistern situated at a maximum height of 27 metres (90ft) above the boiler.

The cold feed must be 15mm minimum size.

The vent must rise continuously and be unrestricted.

It is important that the relative positions of the pump, cold feed and open vent are as shown in diagram 4.2.

Diagram 4.1

Diagram 4.2

Table 3. Flow Rate

<table>
<thead>
<tr>
<th>OUTPUT</th>
<th>MINIMUM FLOW RATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>18</td>
<td>773.8 litres/hr (12.9litres/min)</td>
</tr>
<tr>
<td>31</td>
<td>1289 litres/hr (21.5litres/min)</td>
</tr>
</tbody>
</table>

This is equal to 20°C differential across the appliance.
4.8 Combined Feed and Vent
For combined feed and vent, a 22mm pipe must be fitted in accordance with BS 5449.

4.9 Domestic Hot Water Cylinder
SINGLE FEED INDIRECT CYLINDERS ARE NOT SUITABLE
The domestic hot water cylinder must be of the double feed fully indirect coil type.

Thermal Stores
This appliance is suitable for installation with thermal stores, however, the appliance should be adjusted to give the maximum 31kW output.

4.10 Domestic Hot Water System - unvented
General - All domestic hot water circuits, connections, fittings must be in accordance with the relevant standards and water supply regulations.
For GB: Guidance G17 to G24 and recommendation R17 to R24 of the Water Regulations Guide.
For IE: The current edition of I.S.813 "Domestic Gas Installations".
Where a storage system will not have a vent to atmosphere the installation must comply with the building regulations and local Water Company bylaws, see also the current issue of BS5546 and BS6700.
If fitting to an existing system the local authority should be informed.

4.11 Sealed water Systems
The installation must comply with the appropriate requirements of the current issue of BS4814, BS5449, BS6759, BS6798 and BS7074 Part 1 and 2.
See diagram 4.3 for a suggested layout.

4.12 Safety Valve
A safety valve must be fitted to a sealed system.
It shall be preset, non-adjustable with a lift pressure of 3 bar, incorporating seating of a resilient material, a test device and a connection for drain.
The drain from the safety valve must be routed outside the building, must not discharge above an entrance or window or any type of public access area, be clear of any electrical fittings and positioned so that any discharge can be seen.

4.13 Expansion Vessel
A diaphragm type expansion vessel, conforming to the current issue of BS4814 (see also BS7074 Part 1 and 2) must be connected at a point close to the inlet side of the circulating pump, see the diagrammatic layout, diagram 4.3 unless laid down differently by the manufacturer.
The expansion vessel volume depends on the total water system volume and the initial system design pressure. For any system an accurate calculation of vessel size is given in the current issue of BS5449 and BS7074 Part 1.
Example: For an initial design pressure of 0.7 bar, the minimum total vessel volume required is 0.063 x Total System Volume.
NOTE: A higher initial design pressure requires a larger volume expansion vessel.
Guidance on vessel sizing is also given in the current issue of BS5449 and BS7074 Part 1, for IE refer to the current edition of I.S.813 "Domestic Gas Installations".
The charge pressure must not be less than the static head of the system, that is, the height of the highest point of the system above the expansion vessel.
4 Water System

4.14 Pressure Gauge
A pressure gauge with a set pointer and covering at least 0 to 4 bar (0 to 60 lb/in²) shall be fitted permanently to the system in a position where it can be seen when filling the system.

4.15 Domestic Hot Water Cylinder
SINGLE FEED INDIRECT CYLINDERS ARE NOT SUITABLE
The domestic hot water cylinder must be of the double feed fully indirect coil type. It must be suitable for working at a gauge pressure of 0.35 bar above the safety valve setting.

4.16 Water Make-up
Provision should be made for replacing water loss from the system using a make up bottle mounted in a position higher than the top point of the system, connected through a non-return valve to the return side of either the heating circuit or the hot water cylinder.
Alternatively, provision for make up can be made using a filling loop.

4.17 Filling a Sealed Water System
Provision for filling the system at low level must be made, see diagram 4.4. There must be no permanent connection to the mains water supply, even through a non-return valve. We do not recommend filling using artificially softened water.

5 Installation Preparation

5.1 Appliance Pack
IMPORTANT: With regards to the Health and Safety Manual Handling requirements, two persons shall be required to lift the appliance, refer to manual handling on page 4.

Lift the boiler out of the carton

NOTE: The fittings pack and the flexible condensate outlet pipe are located in the base polystyrene packing under the boiler base and the bottom cover is located at the back of the boiler. Remove both and put to one side.

Remove the polystyrene end packing pieces then carefully lay the boiler on its back, remove the two front casing panel securing screws and lift off the panel from two retaining lugs, see diagram 5.1.

Remove the transit packaging behind the front panel and discard.

Carefully place front panel and screws to one side.

5.2 Wall Template
Remove the wall template from the documentation pack and place in the desired position on a flat wall, giving due consideration to boiler clearances, see Section 2.2, and the flue you are fitting.
5 Installation Preparation

5.3 Flue Hole Cutting

The *standard horizontal flues* are designed with an internal fall of 44mm/metre towards the boiler for disposal of condensate. If the standard flue length alone is being used then the flue hole of diameter 105mm can be cut in the position marked on the wall template.

For *standard side flues* the horizontal flue centre line on the wall template should be extended to the side wall, and the vertical centre of the flue hole marked at 176mm from the back wall.

For installations with external access, a 105mm diameter core drill can be used.

For installations with internal access only a 125mm diameter core drill should be used.

When using extension pipes with the horizontal rear flue, a core drill size of 125mm should be used to allow the extension pieces to slope at 44mm/metre (2.5°) towards the boiler.

For *extended side flues* the flue hole centre should be determined by extending the dashed inclined line on the template to the side wall. This dashed line is drawn at 44mm/metre (2.5°) rise from the boiler. Where this line reaches the side wall, a horizontal line should be marked. The vertical centre line of the flue should then be marked at 176mm from the back wall, see diagram 5.2.

To allow for the flue passing through the wall at this angle a 125mm hole should be drilled irrespective of internal or external installation.

If necessary remove the wall template whilst drilling the flue hole.

6 Boiler Fixing

6.1 Hanging Bracket Fixing

If previously removed, reposition the wall template over the flue hole and mark the position of the fixing holes for the hanging bracket, see diagram 6.1.

Mark and drill the fixing holes and secure the hanging bracket, which is supplied in the polystyrene pack.

**NOTE:** Due to the varied site conditions we do not supply fixings and advise that the installer should supply those which are suitable.

6.2 Boiler Fixing

**IMPORTANT:** With regards to the Manual Handling Operations, 1992 Regulations, the following lift operation exceeds the recommended weight for a one man lift, refer to Manual Handling section on page 4.

Lifting the boiler into position, lean the top of the boiler slightly to the wall and position just above the hanging bracket. Lower the boiler slowly and engage onto the hanging bracket.

Make good the final connections.
7 Gas, Water and Condensate Connections

7.1 Gas Connection
Before connection check the supply of local gas.
The gas supply can be connected from below, see diagram 7.1.
or through the wall at the rear of the boiler.
Refer also to section 1.2 and 1.3.
The whole of the gas installation, including the meter, should be inspected, tested for soundness and purged in accordance with the document IGE/UP/1B.

7.2 Water Connections
Provision is made for the water connections to be made from above the boiler, see diagram 7.2. The position is shown on the wall template.
Flush out the domestic hot water and the heating systems before connecting to the boiler.

7.3 Condensate Drain Connection
The condensate drain connection is at the rear of the boiler, see diagram 7.1. A flexible condensate outlet pipe is supplied loose in the base polystyrene packaging. The 90° end of the flexible condensate outlet pipe should be used to fit onto the spigot, to discharge condensate to a drain. The drain pipe 22mm to 25mm OD. non corrosive plastic pipe should have a fall of at least 2.5° away from the boiler.
Condensate should, if possible be discharged into the household internal drainage system. If this is not practicable, discharge can be allowed into the external household drains or a purpose designed soak away, refer to diagram 7.3.
It is recommended that any external condensate drain pipe is preferably of 32mm diameter, to prevent freezing in adverse weather conditions.
The condensate is discharged periodically in ‘slugs’ by siphonic action.
It is not necessary to provide air breaks or extra traps in the discharge pipe as there is already a 75mm high trap inside the boiler. Fitting an extra trap may cause the boiler siphon to work incorrectly.
Refer to BS5546 or BS6798 for advice on disposal of boiler condensate.
7 Gas, Water and Condensate Connections

**Internal Soil and Vent Stack**

- Ø22mm MIN.

**External Soil and Vent Stack**

- Ø22mm MIN.
- NO RESTRICTION ON LENGTH

**External Termination into a Gulley or Hopper**

- Ø22mm MIN.
- NO RESTRICTION ON LENGTH

**Internal Termination Downstream of Sink Waste**

- Ø22mm MIN.
- NO RESTRICTION ON LENGTH

**Internal Termination into Combined Sink Waste**

- Ø22mm MIN.
- NO RESTRICTION ON LENGTH

**External Termination into Soakaway**

- Ø22mm MIN.
- TERMINATION FROM APPLIANCE.

**Diagram 7.3**

*NOTE: PIPEWORK SHOULD ALWAYS FALL AWAY FROM BOILER BY AT LEAST 2.5° 44mm FOR EVERY 1M.*
8.1 Flue Components

The components supplied in the Standard and Telescopic kit are shown in diagram 8.1.

Additional flue accessories are available to suit your site conditions, see diagram 8.2.
8. Flue Preparation Telescopic and Standard Flue

8.2 Flue Length

Top Rear flue - Standard - with the flue elbow temporarily fitted, measure the distance from the outside wall to the butt joint, see diagram 8.3. If the measurement ‘Y’ exceeds 652mm, then the appropriate length of extension pipe is required. The minimum dimension is 187mm to suit a 75mm min wall thickness.

Top Rear flue - Telescopic - with the flue elbow temporarily fitted, measure the distance from the outside wall to the butt joint, see diagram 8.3. If the measurement ‘Y’ exceeds 525mm, then the appropriate length of extension pipe is required, if the dimension is less than 320mm DO NOT cut the flue, it can project to a maximum of 600mm, if this is not desirable then a Standard flue MUST be used and cut to length.

Top Side flue - Standard - with the flue elbow temporarily fitted, measure the distance from the outside wall to the butt joint, see diagram 8.4. If the measurement ‘Y’ exceeds 652mm, then the appropriate length of extension pipe is required. The minimum dimension for Lhd is 270 and Rhd 167 to suit a minimum wall thickness of 75mm.

Top Side flue - Telescopic - with the flue elbow temporarily fitted, measure the distance from the outside wall to the butt joint, see diagram 8.4. If the measurement ‘Y’ exceeds 525mm, then the appropriate length of extension pipe is required, if the dimension is less than 320mm DO NOT cut the flue, it can project to a maximum of 600mm, if this is not desirable then a Standard flue MUST be used and cut to length.

8.3 Preparation

Telescopic:
The Telescopic Flue system MUST NOT be cut. Adjust the flue to your required length “Y”, ensure the air duct seams line up mark the securing hole position in the air duct. Drill a 3mm diameter hole at this position, take care not to pierce the inner flue duct. Secure with screw provided and tape the joint, see diagram 8.5.

Standard:
Separate the flue duct from the terminal by twisting to release the terminal catch, then pull out of the retaining seal, refer to diagram 8.6.

The duct cutting lengths are shown in diagram 8.6.

The air duct should be cut at the opposite end to the terminal fixing.

The terminal plastic flue duct MUST be cut at the opposite end to the catch.

The plastic flue duct extensions MUST be cut at the opposite end to seal.

The cut ducts must be de-burred and all filings and debris removed.

NOTE: If you require to lubricate the seals to ease installation, please do not use a mineral oil based grease, we would recommend the use of water.
8.4 Flue Fitting (Telescopic and Standard)

Fit the rubber sealing collar behind the locating lugs on the flue terminal, see diagram 8.7.

Push the flue assembly into the wall, externally or internally, initially until the end of the assembly protrudes a short way from the inside face of the wall. This will enable the internal trim ring if required to be positioned and allow the flue duct to be drawn back into the flue elbow.

Secure the flue elbow in position on top of the boiler with four torque headed screws supplied.

Draw the flue assembly from wall and engage the flue duct into the elbow and butt fit between the air duct and flue elbow.

Ensure alignment of the terminal.

Fit the collar into position, mark through two of the pre drilled holes in the collar. Remove collar and drill two 3mm diameter holes in the elbow, take care not to pierce the inner flue duct.

Fit the collar and secure with screws provided, see diagrams 8.8 standard rear, 8.9 telescopic rear, 8.10 standard side and 8.11 telescopic side.

NOTE: If the air and flue ducts have been correctly cut to the instructions given in section 8.2, the rubber sealing collar should fit flush with the outside wall, check this.

Slide the internal trim ring back against the wall, securing in place with a small amount of sealant if required.
WARNING: This boiler must be earthed.

This appliance must be wired in accordance with these instructions. Any fault arising from incorrect wiring cannot be put right under the terms of the guarantee.

All system components must be of an approved type.

Electrical components have been tested to meet the equivalent requirements of the BEAB.

Connection of the whole electrical system and any heating system controls to the electrical supply must be through a common isolator.

Isolation should preferably be by a double pole switched fused spur box having a minimum contact separation of 3mm on each pole. The fused spur box should be readily accessible and preferably adjacent to the boiler. It should be identified as to its use.

A fused three pin plug and shuttered socket outlet may be used instead of a fused spur box provided that:

a) They are not used in a room containing a fixed bath or shower.

b) Both the plug and socket comply with the current issue of BS1363.

The mains electrical supply must be maintained at all times in order to provide domestic hot water.

Do not interrupt the mains supply with a time switch or programmer.

9.1 External controls (Mains Voltage)

Important: If a replacement supply cable is required it must be purchased. Part No. S1008600.

Ensure that a separate external controls cable and pump supply cable are fed to the boiler.

Refer to wiring diagram in section 12.

The boiler is fitted with a connection box located at the base of the boiler into which all connections are made.

To gain access to the connection box remove the two retaining screws indicated in Diagram 9.1 and carefully lower and pull forward the box to reveal the terminal strip inside.

Remove the test cable from the terminal strip and discard.

Connect both the mains supply and switched live from the external controls (room thermostat and, if applicable, frost thermostat) into the marked terminals as shown in diagram 9.2.

If a room thermostat is not fitted, then the connecting link must be fitted between terminals 1 and 2, see diagrams 9.2 and 12.2.

Connect the pump supply into the marked pump terminals as shown in diagram 9.2.

Observe all terminal markings and colour codes as shown in diagram 12.2.

NOTE: The boiler incorporates a pump overrun thermostat. Only feed the pump from the marked terminals in the connection box on the boiler, not from a separate supply.

Ensure that all flexible cords are routed through the strain relief cable glands on the inlet of the connection box.

Refit the connection box to the underside of the boiler using the two retaining screws.
9 Electrical Connections

9.2 Electrical connections - testing
Carry out preliminary electrical system checks as below:
1. Test insulation resistance to earth of mains cable.
2. Test the earth continuity and short circuit of cables.
3. Test the polarity of the mains.

9.3 Pump Connection
Ensure that a separate pump supply cable is fed to the boiler, see diagram 9.2.
Remove connection box, see diagram 9.1.
Route the pump supply cable through the strain relief cable gland, connect to the connection box as shown in diagram 9.2.
Refer to diagram 12.1 for wiring colour code.
Refit the connection box to the underside of the boiler using the two retaining screws.

10 Commissioning

Please ensure the British Gas logbook is completed and left with the user.

10.1 Preliminaries - All Systems
Remove the casing panels, see diagram 10.1.
A competent person in accordance with the current issue of BS6798 should carry out commissioning.
Make sure that the system has been thoroughly flushed out with cold water.
Refill the system with water, making sure that all the air is properly vented from the system and pump, diagram 10.2 shows vent point.
Before operating the boiler check that all external controls are calling for heat. Do not operate the boiler without water.
Allow the system to reach maximum temperature then switch off the boiler by isolating from the electrical supply.
Drain the entire system rapidly whilst hot, using the drain tap at the lowest part of the system. Following completion of the hot flush, add inhibitor to the system.

10.2 Sealed Systems
Fill the system until the pressure gauge registers the recommended pressure. Clear any air locks and check for leaks.
Release the cold water to the initial design pressure.

Diagram 10.1
10 Commissioning

10.3 Preparation for Lighting
Isolate the boiler from the mains electrical supply.
Test for gas soundness and purge air from the gas supply. Turn on the gas service cock, slot in line with the length of the valve, see diagram 7.1.

10.4 Initial Lighting
The lighting procedure of the boiler is fully automated.
Check that all external controls are calling for heat. If an integral programmer is fitted check that it is correctly programmed and if necessary overridden to provide heat.
Ensure that the water temperature control knob is turned OFF ( ).
Turn on the mains electrical supply and the mains reset switch to (I) on the controls fascia.

Turn the water temperature control knob to ( ) MINIMUM.
The fan should start and after a few seconds the ignition will commence.
If the burner fails to light the fan will stop. Initially this may be due to air in the gas supply line. The boiler will automatically have three attempts at ignition.
If necessary turn the mains reset switch to the off position (O), then back to the on position (I) and the boiler will restart.
After the boiler has lit, allow to warm at MINIMUM temperature setting to purge any air from the system.

NOTE: If the appliance is operated above MINIMUM on initial lighting, there is a possibility that the overheat stat will trip, this is due to air in the system having not been purged. See diagram 10.4 for overheat thermostat/reset switch.
Once the system has been purged of air turn the central heating knob to the desired temperature.
The appliance will then continue to fire until the user controls are satisfied.

NOTE: After first power up the firing sequence for central heating changes. After one minute stabilisation time the boiler will ramp slowly to full rate rather than going immediately to full rate. This is an adaptive feature to cope with small system requirements.

10.5 Range Rating
NOTE: This appliance is factory set at 18kW output.

IMPORTANT: If the seal on the 'Pmax' potentiometer is broken the gas supply, without exception, must be capable of delivering 31.3kW input.

On completion of the adjustment, the inlet working pressure of the appliance should be checked to ensure a steady inlet working pressure of 20Mbar is achieved.
The appliance data label must be completed to indicate the maximum output using the rate indicating label provided in the literature pack.

NOTE: This appliance is suitable for installation with thermal stores, however, the appliance should be adjusted to give the maximum 31kW output.

To Adjust to 24 or 31kW:
Remove casing panel, see diagram 10.1.
With the power off and the appliance cold, unclip the controls fascia and hinge it down to reveal the potentiometers on the rear of the User interface, see diagram 10.5. Take care not to allow the fascia to drop down and damage the wiring.

Turn on the electrical supply.
Ensure external controls are calling for heat. The boiler should fire automatically.
Allow the boiler to fire for a minimum of 60 seconds and then, using an electrical screwdriver, rotate the 'service' potentiometer fully clockwise, see diagram 10.5. This will allow the digital display to indicate the 'flashing' fan speed on the appliance fascia.
In the fully clockwise position the display should be indicating the maximum fan speed of the appliance which is factory set to 18kW.
Use 'Pmax' potentiometer to adjust the fan speed to the number corresponding to the maximum output required, see table 4.
To adjust to 24 or 31kW output the security seal on the 'Pmax' potentiometer must be broken for access and adjustment.
Rotate the 'service' potentiometer fully anti-clockwise so that the digital display indicates the water temperature.
Check the gas rate, refer to Section 10.6.
Close the fascia panel and replace the chassis front, inner casing panel, front casing panel and fit the bottom cover, see diagram 10.6.

10.6 Testing - Gas (Natural Gas only)
Refer to Table 4 for Burner CO$_2$ levels. Should any doubt exist about the gas rate, check it using the gas meter test dial and stop watch at least 10 minutes after the burner has lit, making sure that all other gas burning appliances and pilot lights are off.
The gas valve is factory set for natural gas (G20) and should need no adjustment. It should be checked that the supply pressure is 20mb when the boiler is firing at full rate. This can be achieved by checking the inlet pressure at the pressure test point on the gas valve shown in diagram 10.3 using range rating table 4.

Disconnect pressure gauge.
Note that the burner pressure cannot be measured at the gas valve as it is altered by the suction of the fan and modulated according to demand.
Replace inner casing panel and casing panel.

10.7 Testing - Heating System
Check that all remote controls are calling for heat. The boiler will fire automatically. Fully open all radiator valves, flow control valve 'A' and bypass valve 'B', see diagram 4.3.
Balance the radiators as required and if fitted adjust valve 'A' to give the required system differential. Turn off all radiators that can be shut off by the user and check to see if less than the maximum differential allowed of 20°C can be achieved across flow and return.
Allow the system to reach maximum temperature then switch off the boiler by isolating from the electrical supply.
Drain the entire system rapidly whilst hot, using the drain tap at the lowest part of the system. Fill and vent the system as described previously in section 10.1.

Lock or remove the handles from controls valve 'A' to prevent unauthorised adjustment.

10.8 User Controls and Options
The mains reset switch is used to restart the boiler after a fault condition has occurred, i.e. ignition failure.
The water temperature control knob allows the user to set the desired temperature.

Temperature Display
The digital display normally shows the operating temperature of the unit.
10.9 Pump Exercise Program

After a power cut or every 24 hour in frost setting/summer mode the pump will run for one minute to prevent it from sticking. This will also occur during normal operating if there is no demand for more than 24 hours.

10.10 Frost Protection

The boiler has a built in frost protection programme as long as the electricity and gas are left switched on.

This device operates the burner and system pump when the temperature inside the boiler falls to 3°C.

When the temperature inside the appliance reaches 10°C the burner will shut down and after a short period the pump will stop.

This device primarily protects the boiler. Any other exposed areas of the system should be protected by a separate frost thermostat.
10 Commissioning

10.11 Instruct the User

Instruct and demonstrate the lighting procedure and advise the user on the safe and efficient operation of the boiler.

Instruct on and demonstrate the operation of any heating system controls.

Advise the user on the use and maintenance of any scale reducer and pass on any relevant instructional documents.

Advise that to ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the installation conditions and usage, but in general, once a year should be enough.

Draw attention, if applicable, to the current issue of the Gas Safety (Installation and Use) Regulations, Section 35, which imposes a duty of care on all persons who let out any property containing a gas appliance.

It is the Law that any servicing is carried out by a competent person.

Advise the user that, like all condensing boilers this appliance will produce a plume of condensation from the flue terminal in cool weather. This is due to the high efficiency and hence low flue gas temperature of the boiler.

Advise the user of the precautions necessary to prevent damage to the system, boiler and the building, in the event of the heating system being out of use during frost or freezing conditions.

Advise the user that the permanent mains electrical supply SHOULD NOT be switched off, as the built in frost protection and pump saver program would not be operable.

Reminder, leave these instructions and the British Gas logbook with the user.

10.12 Completion

Adjust the boiler temperature control and any system controls to their required settings. In addition it is necessary to complete the British Gas logbook.

NOTE: Scottish Gas only. Remove the British Gas badge from the front casing panel. Replace with the Scottish Gas badge supplied in the fixing pack.

Testing Flue Gases: If any doubt exists that the flue products are not exhausting correctly, investigate by use of a gas analyser (FGA).

For IE, it is necessary to complete a "Declaration of Conformity" to indicate compliance to I.S.813. An example of this is given in the current edition of I.S.813.

Diagram 10.6

STEP 1

STEP 2

STEP 3

BOTTOM COVER
11 Servicing

IMPORTANT NOTES:

1. To ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the particular installation and usage, but in general once a year should be enough.

2. It is the Law that any servicing is carried out by a competent person.

3. Before commencing with a service or replacement of parts the boiler should be isolated from the electrical supply and the gas supply should be turned off at the gas isolation valve.

4. When replacing a part on this appliance, use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by British Gas.

5. On completion of servicing the “Benchmark” log book should be completed.

11.1 General Inspection

Prior to servicing carry out an initial inspection of the following:
1. Condition of case and flue.
2. Flue terminal for obstructions.
3. Electrical supply connections.
5. Gas connection.

11.2 Functional Checks

With the appliance operational carry out the following functional checks:

1. Check the combustion, preferably with a flue gas analyser as described in section 11.8. If a flue gas analyser is not available remove the outer and inner case, see diagram 10.1, and taking care not to touch any components, check the flame picture through the viewing window, diagram 11.1. Should the flame show signs of lift, sooting or appear yellow then it will be necessary to service the burner, if the servicing does not correct the condition, then proceed to the combustion test described in section 11.8.

2. Measure the gas rate during operation. If the gas rate is lower than the minimum gas rate the burner will require servicing. Should the combustion measurement or flame and gas rate be correct, then it is not necessary to remove the burner assembly for a service.

11.3 Servicing

All routine servicing requirements can be achieved by the removal of the front panel and inner panel and chassis front only.

Before commencing with a service or replacement of parts. The boiler should be isolated from the electrical supply and the gas supply should be turned off at the gas service cock, see diagrams 11.2 and 11.3.

Unless stated otherwise parts are replaced in the reverse order to removal.

11.4 Spark Electrode

Disconnect the electrode lead and two securing screws. Withdraw the spark electrode carefully from the combustion chamber, see diagram 11.4 and 11.6.

Inspect the tips for damage.

Clean away any debris and check the spark gap is 3.5 to 4.5 mm.

Check the electrode gasket for signs of damage and replace if necessary.

If the burner is not to be serviced continue from section 11.9.
11 Servicing

11.5 Burner

NOTE: IF THE FUNCTIONAL CHECKS DID NOT INDICATE POOR COMBUSTION THEN IT IS NOT NECESSARY TO SERVICE THE BURNER.

The following procedure will require that you replace the burner door seal and nyloc nuts. Disconnect the gas supply at the gas service cock.

NOTE: DO NOT DISCONNECT AT THE GAS VALVE.

Remove the two gas pipe bracket securing screws from underside of inner case, see diagram 11.3.

Drop down the control panel into the service position.

Remove the four screws from the chassis front, see diagram 11.5.

Remove the chassis front by pulling it out at the top from its retaining slots.

NOTE: When replacing chassis front panel ensure the bottom fits behind lip.

Disconnect the gas valve electrical plug at the gas valve, see diagram 11.6.

Disconnect the electrical leads from the fan.

Remove the five combustion chamber burner door securing nuts, see diagram 11.7, these should be discarded and replaced with the new nylocs nuts supplied in the burner door seal kit.

Gently remove the fan, gas valve and burner assembly from the combustion chamber complete with the gas pipe bracket and seal.

Clean the burner with a soft brush taking great care not to damage the front insulation. DO NOT use wire or sharp instruments to clean the holes of the burner.

Inspect the burner for any signs of damage.

Removal of the burner is not necessary during a normal service, see diagram 11.7.

NOTE: IF THE BURNER HAS TO BE REMOVED IT WILL REQUIRE A NEW GASKET WHEN REFITTED, REFER TO DIAGRAM 11.8.

Remove and discard the burner door seal and replace with new see diagram 11.7.

NOTE: When replacing ensure that the sealing grommet, situated below the gas valve is correctly re-seated

11.6 Combustion Chamber and Heat Exchanger.

Refer to diagram 11.7.

Remove loose debris from combustion chamber using a soft brush and vacuum cleaner. Carefully flush by spraying water any remaining debris through the condensate trap (Ensure the water is kept away from electrical components).

11.7 Condensate Drain

The condensate drain does not normally need removing during servicing.

To flush the condensate drain carefully pour water into the heat exchanger and check that water flows freely to drain.

If the condensate drain becomes blocked refer to section 13.16 for removal.

BURNER
SECURING SCREW (4)

GASKET
11.8 Combustion Check

Once the appliance has been reassembled (apart from the front and inner casing panels) connect a flue gas analyser to the sample point on the flue elbow, see diagram 11.9.

Turn on the gas service cock, see diagram 11.3.

With the power off and the appliance cold, unclip the controls fascia and hinge it down to reveal the potentiometers on the rear of the User interface, see diagram 11.10. Take care not to allow the fascia to drop down and damage the wiring.

Turn on the electrical supply.

Ensure external controls are calling for heat. The boiler should fire automatically.

Allow the boiler to fire for a minimum of 60 seconds and then, using an electrical screwdriver, rotate the ‘service’ potentiometer fully clockwise, see diagram 11.10. This will allow the digital display to indicate the ‘flashing’ fan speed on the appliance fascia.

This should correspond to the range rated output of the boiler, as indicated on the boiler data label. If the appliance is set to 18kW and the security label on the Pmax potentiometer is intact this is the maximum output for the boiler. If the seal is broken the output should be taken as 31kW, with an adequate gas supply, see Range Rating Table 4, in section 10.

Carry out a performance test, the CO₂ level should be 9.1% ± 0.3.

If adjustment is necessary, refer to section 13.5, Replacement of Parts.

Turn the service potentiometer back fully anti-clockwise to return the boiler to normal operation, close the front fascia panel and replace the cap on the sampling point.

11.9 Inner Casing Panel Seal Check.

Refer to diagram 11.11.

Check the condition of the seal, replace as required.

To replace remove the old seal, thoroughly clean the casing surfaces. Fit the new seal, it is supplied to the correct length.

11.10 Completion

The Benchmark log book should be completed.
12 Fault Finding

12.1 Important Notes
Before trying to operate the boiler make sure that:

• All gas supply cocks are open and that the gas supply has been purged of air.
• There is a permanent mains supply to the boiler.
• There is a heating demand from the external controls.
Always check for gas soundness after any service work.

12.2 Electrical Testing
Should there be any doubt about the voltage supply to any of the components, it is possible to carry out a simple electrical test.

**Important.** On completion of the Service/Fault Finding tasks which have required the breaking and remaking of the electrical connections the earth continuity, polarity, short circuit and resistance to earth checks must be repeated using a suitable multimeter.

To carry out the electrical test, gain access, as follows:

Hinge down the control box and remove Torx screws and unhook the rear panel, refer diagram 12.1.

Refer to the Wiring diagram 12.2 and fault finding charts diagrams 12.3 and 12.4.
12 Fault Finding

Diagram 12.3

Is there temperature indicated on LCD?

YES

Ensure external controls are calling for demand. Wait 60 seconds.

YES

Does ‘F’ flash?

YES

NO

Does boiler modulate before desired set point is reached?

YES

Differential is too high.
- Current flow rate too low.

NO

Does boiler go off before desired set point is reached?

YES

Temperature rise too high.
- Current flow rate too low.

NO

Correct operation.

NO

Is a ‘F’ displayed?

YES

Check wires between main pcb and interface.

NO

REFER TO DIAGRAM 12.4.

This would cause no pump overrun |
| F6   | Central heating flow thermistor fault | Thermistor cable defective/broken, thermistor faulty  
Check that thermistor attached correctly to pipe |
| F10  | Central heating return thermistor fault | Thermistor cable defective/broken, thermistor faulty  
Check that thermistor attached correctly to pipe |
| F11  | Main board connection fault | Check wiring between mainboard and user interface |
| F12  | User interface connection fault | Check wiring between mainboard and user interface |
| F13  | Main PCB connection fault | Check connections and wires |
| F14  | Central heating flow temperature is greater than 95°C | System fault  
Possible pump failure  
Check Thermistor on flow |
| F16  | Flame detection fault (flame presence for more than 5 seconds after burner stop) | Gas valve defective |
| F17  | Power supply is less than 170V | Check electrical supply / polarity |
| F18  | User interface fault | Faulty User Interface |
| F19  | Central heating thermistor unplugged | Check Thermistor connection |
| F20  | Software incompatibility | Incorrect user interface or Main PCB |
| F24  | Central heating return temperature is greater than 90°C | System fault  
Possible pump failure  
Check Thermistor on return |
| F25  | Maximum temperature rise slope | Possible pump failure  
Air in system |
| F26  | Maximum delta temperature | Check Thermistor on return  
System - too restrictive |

Diagram 12.4
13 Replacement of Parts

13.1 Important Notes
When replacing a part on this appliance, use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by British Gas.

Replacement of parts must be carried out by a competent person.

Before replacing any parts the boiler must be isolated from the mains electric supply and the gas must be turned off at the service cock on the boiler, see diagrams 11.2 and 11.3.

Unless stated otherwise parts are replaced in the reverse order to removal.

After replacing any parts always test for gas soundness and if necessary carry out functional test of the controls.

For replacement of parts, remove the casing panels and chassis front panel of the boiler, see diagrams 10.1 and 11.5.

Remove the two screws on the underside of the front casing, then undo the two screws on the front of the inner front panel and lift off. Remove the four screws from the chassis front panel, then remove it by pulling it out at the top from its retaining slots.

NOTE: When replacing chassis front panel ensure the bottom fits behind the lip.

The side panels can be hinged sideways to aid replacement of parts.

Undo and remove the three screws securing each side panel to the boiler, two at the front and one at the top.

NOTE: The following replacement parts in sections 13.5 to 13.9 will require the removal of the burner door assembly. This will require that you replace the burner door seal and nyloc nuts.

13.2 Spark Electrode
For access, refer to section 13.1.

Remove the spark plug lead, earth lead and two securing screws. Withdraw the spark electrode carefully from the combustion chamber, see diagram 11.4.

13.3 Igniter Unit
For access, refer to section 13.1.

Remove ignition lead and electrical connections, see diagram 13.4.

Remove igniter unit by removing two securing screws, see diagram 13.4.

13.4 Ignition Lead
For access, refer to section 13.1.

Refer to diagram 11.6.

Pull the spark plug style connector off the spark electrode and the spade connector connected to the igniter unit.

13.5 Gas Valve
For access, refer to section 13.1.

Refer to section 11.5 for removal of the fan, gas valve and burner assembly.

Before removing the gas valve note its position on the fan.

Remove the three securing screws, which fix the gas valve, plastic swirl plate to the venturi on the fan.

Remove the gas valve.

Remove the gas supply pipe from the gas valve.

When refitting the gas valve take care as it can be fitted more than one way.

After assembly test for gas soundness and purge in accordance with the current issue of BS6891 or in IE, the current edition of I.S.813 “Domestic Gas Installations”.

Once the appliance has been reassembled (apart from the front and inner casing panels) the gas valve may require adjustment.

Connect a CO₂ combustion analyser to the sampling point on the flue elbow, see diagram 11.8.

Turn on the gas service cock, see diagram 11.3.

With the power off and the appliance cold, unclip the controls fascia and hinge it down to reveal the potentiometers on the rear of the User interface, see diagram 11.10. Take care not to allow the fascia to drop down and damage the wiring.

Turn on the electrical supply.

Ensure external controls are calling for heat. The boiler should fire automatically.

Allow the boiler to fire for a minimum of 60 seconds and then, using an electrical screwdriver, rotate the ‘service’ potentiometer fully clockwise, see diagram 11.10. This will allow the digital display to indicate the ‘flashing’ fan speed on the appliance fascia.

This should correspond to the range rated output of the boiler, as indicated on the boiler data label. If the appliance is set to 18kW and the security label on the Pmax potentiometer is intact this is the maximum output for the boiler. If the seal is broken the output should be taken as 31kW, with an adequate gas supply, see Range Rating Table 4.

If adjustment proves necessary then proceed as follows:
Any adjustment to the gas valve should only be carried out by a competent person.

Refer to diagram 10.3.

Adjust the CO₂ with the throttle to 9.1% + 0.3 - 0.3. (Rotate anti-clockwise to increase).

Rotate the ‘service’ potentiometer fully anti-clockwise. Hold it in this position for about 5 seconds before rotating the service potentiometer clockwise to the mid-point or 3 o’clock position. The fan should reduce to 1200 rpm which will flash ‘12’ on the digital display.

Check the CO₂ value which should be 9.1% + 0.3 - 0.3.

If adjustment of the CO₂ at minimum rate is required, it is very coarse so carefully adjust the CO₂ with the offset adjustment to 9.1%, see diagram 10.3.

Rotate the ‘service’ potentiometer fully clockwise, see diagram 11.10, and recheck the combustion, which should be 9.1% + 0.3 -0.3.

Turn the service potentiometer back fully anti-clockwise to return the boiler to normal operation, close the front fascia panel and replace the cap on the sampling point.
13.6 Fan
For access, refer to section 13.1.
Remove electrical plug.
Refer to section 11.5 for removal of the fan, gas valve and burner assembly.
Remove the gas valve as described in the relevant parts of section 13.1.
Remove the venturi plate secured with three screws and remove the two screws securing the fan to the gas manifold, see diagram 13.1.
Check the gasket and replace if necessary.

13.7 Burner
For access, refer to section 13.1.
Refer to section 11.5 for removal of the fan, gas valve and burner assembly.
Remove the four screws that secure the burner.
NOTE: THE BURNER WILL REQUIRE A NEW GASKET WHEN REFITTED.

13.8 Front Insulation
For access, refer to section 13.1.
Refer to section 11.5 for removal of the fan, gas valve and burner assembly.
Remove burner as per section 13.7.
Remove spark electrode, see section 13.2.
NOTE: THE BURNER WILL REQUIRE A NEW GASKET WHEN REFITTED.

13.9 Rear Insulation
For access, refer to section 13.1.
Refer to section 11.5 for removal of the fan, gas valve and burner assembly.
Remove securing screw and washer in the centre of the insulation and withdraw insulation, see diagram 13.2.

13.10 Viewing Window
For access, refer to section 13.1.
Refer to diagram 13.3.
Remove circlip.
Remove steel washer.
Remove glass.
Remove fibre washer.
Replace in reverse order.
13 Replacement of Parts

13.11 Heat Exchanger
Refer to Manual Handling section on page 4.
For access, refer to section 13.1.
Refer to section 11.5 for removal of the fan, gas valve and burner assembly.
Drain the boiler.
Remove the clip securing the clear condense pipe to heat exchanger.
Pull to remove the clear condense pipe out of the bottom of the heat exchanger.
Undo the two nuts of the flow and return pipes from the heat exchanger, see diagram 13.4.
Move the pipes away from the heat exchanger.
Loosen the three heat exchanger securing screws and clamps (two at the top and one at the bottom) to remove the heat exchanger, see diagram 13.4.
CAUTION: There will be water in the heat exchanger.
Remove clear condense pipe connector from bottom of heat exchanger.

13.12 Flue Hood
For access, refer to section 13.1.
Remove heat exchanger as per section 13.11.
Remove the two securing screws and pull the flue hood down and away from the flue hood bracket and flue elbow, see diagram 13.5.

13.13 Heating Flow Thermistor
For access, refer to section 13.1.
Refer to diagram 13.6.
Remove the electrical connections from the thermistor.
Remove the retaining clip from the flow pipe.
Remove the thermistor from the retaining clip.
Note that the polarity of the wiring to thermistors is unimportant.

13.14 Heating Return Thermistor
For access, refer to section 13.1.
Refer to diagram 13.6.
Remove the electrical connections from the thermistor.
Remove the retaining clip from the flow pipe.
Remove the thermistor from the retaining clip.
Note that the polarity of the wiring to thermistors is unimportant.

13.15 Overheat Thermostat
For access, refer to section 13.1.
Refer to diagram 13.6.
Remove the electrical connections from the overheat thermostat.
Remove the retaining clip from the flow pipe.
Remove the overheat stat from the retaining clip.
NOTE: When fitting new thermostat, please ensure that it is located correctly onto the flat area of the pipe and the retaining clip is secure.
13.16 Condensate Trap and Siphonic Drain

Refer to diagram 13.7.

Remove the clips securing the flexible tubes to the adapter by twisting the clips slightly to disengage the clip jaws from each other.

Remove flexible tubes from adapter.

Lift off the adapter.

Remove the drain connection downstream of the condense trap.

Remove the two condense trap securing screws. Lift up and carefully remove the condense trap taking care not to spill any water which may be left in the unit. As the unit is lifted remove the flexible pipe on the outlet.

Remove any solids found.

Before removing the float note it’s orientation.

Remove the float to clean it.

Flush water through the trap to remove any remaining solids.

Check for any debris in the outlet pipe of the condensate drain and clean as necessary.

Reassemble and refit the condensate trap.

**IMPORTANT:** Please remove spigot bung before fitting condensate drain connection.

Using a suitable container, flush the heat exchanger until the water appears clear in the container.

Reassemble adapter.

13.17 Inner Casing Sealing Panel

Refer to section 11.9.

13.18 Access to Switches, User Interface and 230v controls Interface

For access, refer to section 13.1.

Release the front of the controls fascia by carefully prising up the two retaining latches, see diagram 11.10.

Do not allow the front of the fascia to swing down and be loosely held by the electrical connections to the mains reset switch and user interface. Either remove the connections or support the fascia.

13.19 Mains Reset Switch

Refer to section 13.18 for access.

Remove electrical leads.

Lift the switch cover.

Remove switch, see diagram 13.8.
13 Replacement of Parts

13.20 User Interface
Refer to section 13.18 for access and diagram 13.9.
Remove electrical plug.
Remove the three securing screws.
Withdraw the board.
When replacing the board refer to instructions supplied with replacement PCB and the appliance data label for indicated maximum output, see Section 10.5 Range Rating.

13.21 230V Controls Interface
For access, refer to section 13.18.
Disconnect the electrical connection from the 230V controls interface board and the electrical connection from the main PCB, see diagram 13.9.
Remove the 230V controls interface retaining screw.
Remove the 230V controls interface board.
When ordering spare parts, contact British Gas's own service organisation using the telephone number on the inside front cover of this booklet.
Please quote the name of the appliance and serial number, to be found on the data label, see diagram 1.2.
If ordering from British Gas also quote the G.C. number of the part.

13.22 Main PCB
For access, refer to section 13.1
Hinge down the control box, see diagram 13.11.
Remove TORX screws and unhook the rear panel.
Remove the electrical connections to the PCB.
Prise back the two PCB retaining clips and withdraw the PCB, see diagram 13.10.
When refitting the rear panel ensure the leads are not trapped.

13.23 Fuse - Main PCB - Control Box
For access, refer to section 13.22.
The fuse is located at bottom right hand side of the PCB, see diagram 13.10.

13.24 Control Box
For access refer to section 13.21.
Remove relevant plugs and connectors, refer to wiring diagram 12.2.
Withdraw grommets and leads so they are hanging loose.
Unthread the retaining strap and remove the control box by drawing it outwards away from its retaining slots, see diagram 13.11.
14 Manual Handling

General recommendations when handling.

Clear the route before attempting the lift. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. Do not twist – reposition feet instead. If 2 persons performing lift, ensure co-ordinated movements during lift. Avoid upper body/top heavy bending - do not lean forward/sideways. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip. Always use assistance if required.

Removal of carton from delivery van.

Recommend 2 person lift or 1 person with use of sack truck. If 1 person is performing lift, straddle the load, tilt and place carton into position on truck. Recommend secure appliance onto truck with suitable straps. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. If 2 persons performing lift, ensure co-ordinated movements during lift. Always use assistance if required.

Carriage of carton from point of delivery to point of installation – ground floor.

Recommend 2 person lift or 1 person with use of sack truck. If 1 person is performing lift, straddle the load, tilt and place carton into position on truck. Recommend secure appliance onto truck with suitable straps. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. If 2 persons performing lift, ensure co-ordinated movements during lift. Clear the route before attempting the lift. If removing boiler from truck straddle the load and tilt forwards to facilitate secure grip. Ensure safe lifting techniques are used – keep back straight – bend using legs. Do not twist – reposition feet instead. Take care to avoid trip hazards, slippery or wet surfaces and when climbing steps and stairs. Always use assistance if required.

Carriage of carton from point of delivery to point of installation – first or higher floor, cellar.

Recommend 2-person lift or 1 person with use of sack truck. If 1 person is performing lift, straddle the load, tilt and place carton into position on truck. Recommend secure appliance onto truck with suitable straps. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. If 2 persons performing lift, ensure co-ordinated movements during lift. Avoid upper body/top heavy bending - do not lean forward/sideways. Clear the route before attempting the lift. If removing boiler from truck straddle the load and tilt forwards to facilitate secure grip. Ensure safe lifting techniques are used – keep back straight – bend using legs. Do not twist – reposition feet instead. Take care to avoid trip hazards, slippery or wet surfaces and when climbing steps and stairs. Always use assistance if required.

Carriage of carton from point of delivery to point of installation – roofspace.

Recommend 2-person lift. Ensure co-ordinated movements during lift. Avoid upper body/top heavy bending - do not lean forward/sideways. Clear the route before attempting the lift. Take care to avoid trip hazards, slippery or wet surfaces and when climbing steps and stairs. When transferring appliance into roofspace, recommend 1 person to be in roofspace to receive the appliance and other person to be below to pass up and support appliance. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. Always use assistance if required. It is assumed safe access, flooring and adequate lighting are provided in the roof space. It is recommended a risk assessment of the roof space area be carried out before moving the appliance into the area to take into account access, stability of flooring, lighting and other factors, and appropriate measures taken.

Unpacking of appliance from carton.

Recommend 2 persons unpack appliance from carton. Always keep working area clear. Recommend cut base end of carton and open carton flaps, then lift boiler forwards from its side onto its base and remove carton by sliding up over the boiler. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. Always use assistance if required. Dispose of packaging in a responsible manner. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance outside packaging.

Positioning of Appliance for Final Installation – no obstructions.

Recommend 2 persons lift appliance to position into place. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, ensure stable balance achieved and lift upwards to position in place on bracket. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Ensure co-ordinated movements to ensure equal spread of weight of load. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – above worktop, foreseeable obstructions etc.

Recommend 2 persons lift appliance to position into place. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, onto worktop if practicable. Ensure stable balance achieved and lift upwards to position in place on bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Avoid upper body/top heavy bending - do not lean forward/sideways. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – within compartment etc. restricting installation.

Recommend 2 persons lift appliance to position into place, space permitting. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, onto worktop if practicable. Ensure stable balance achieved and lift upwards to drop into place on bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. If 1 person positioning onto bracket recommend obtain firm grip supporting base of boiler. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – in roof space restricting installation.

Recommend 2 persons lift appliance to position into place, space permitting. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, ensure stable balance achieved and lift upwards to drop into place on bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. If 1 person positioning onto bracket recommend obtain firm grip supporting base of boiler. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance. It is recommended a risk assessment of the roof space area be carried out before moving the appliance into the area to take into account access, stability of flooring, lighting and other factors, and appropriate measures taken.

Diagram 14.1
EC declaration of conformity

Name and Address of the manufacturer: Vaillant Industrial UK Ltd.
Nottingham Road
Belper, Derbyshire DE56 1JT

Identification of product: Condensing wall-hung heating boiler

Appliance type: British Gas/Scottish Gas 330 - BG 330

The appliance types satisfy the essential requirements of the relevant directives and Standards:

90/396/EEC including amendments
"Directive on the approximation of the law of the member states relating to appliances burning gaseous fuels"
Designed and built to CE-type examination certificate:
PIN no: 87BP32

92/42/EEC including amendments
"Directive of efficiency relating to boiler burning gaseous fuels"
Designed and built according to European Standards:
EN 483
EN 677
EN 60335-1
EN 60529
EN 50165
EN 55014
EN 61000-3-2
EN 61000-3-3

Any change to the appliance and/or any use not according to the instructions will lead to the invalidation of this Declaration of Conformity.
