INTRODUCTION

1 Instructions guidance

1.1 Product documentation

The instructions are an integral part of the appliance and must be handed to the user on completion of the installation in order to comply with the current regulation.

- Carefully read the manual, to understand all the information to enable safe installation, use and servicing. No liability can be accepted in the event of damage for not complying with the guidance in this instruction manual.

These instructions consist of, Installation, Servicing, Fault Finding, Replacement of Parts and Spares. The instructions are an integral part of the appliance and must, to comply with the current issue of the Gas Safety (Installation and Use) Regulations, be handed to the user on completion of the installation.

1.2 Explanation of symbols

![DANGER: Risk of injuries.](image)

![DANGER: Risk of electric shock.](image)

![ATTENTION: Risk of damage to the appliance or to its surroundings.](image)

![IMPORTANT: Important information.](image)

1.3 Guarantee registration

Thank you for installing a new Glow-worm appliance in your home. Glow-worm appliances are manufactured to the very highest standard so we are pleased to offer our customers a Comprehensive 36 month Guarantee.

We recommend you complete and return as soon as possible your guarantee registration card. If your guarantee registration card is missing you can obtain a copy or record your registration by telephoning the Glow-worm Customer Service number 01773 828100.

2 Appliance description

2.1 Safety devices

2.1.1 Overheating safety

The appliance is designed to recognise the potential for an overheat lockout and will shutdown before this happens.

2.1.2 Safety discharge valve

A safety discharge valve and discharge pipe are fitted to the boiler. This valve must not be touched.

- The heating safety valve opens when the pressure in the heating circuit exceeds 3 bars.
- Should there be any discharge from the pipe, isolate the boiler electrical supply and call your installer or Glow-worm’s own service organisation.

2.1.3 Frost protection

The frost protection system operates the pump to start as soon as the temperature in the heating circuit falls below 12°C. The pump stops as soon as the temperature of the water contained in the heating circuit reaches 15°C. If the temperature in the heating system falls below 7°C, the burner ignites until it reaches 35°C. The frost-protection system is active when the appliance is switched on. The system alone cannot ensure that the installation is protected against frost. An separate frost thermostat is necessary to control the temperature of the system.

![DANGER: Your domestic water circuit (hot or cold) is not protected by the boiler.](image)

2.1.4 Condensate drain blockage

During freezing conditions this may be due to the forming of ice in the condense drain external to the house. In this case, a safety device shuts down the appliance.

2.2 Data label

The data label certifies the country where the appliance is intended to be installed.

Data label location:

![Key Data label](image)
2.3 Regulation and statutory requirements

2.3.1 CE Mark

This boiler meets the requirements of Statutory Instrument, No. 3083 The Boiler (Efficiency) Regulations, and therefore is deemed to meet the requirements of Directive 92/42/EEC on the efficiency requirements for new hot water boilers fired with liquid or gaseous fuels. Type test for purposes of Regulation 5 certified by: Notified body 1312. Product/production certified by: Notified body 0086.

The CE mark indicates that the appliances described in this manual are in compliance with the following directives:

- European directive n°2009-142 relative to gas appliances
- European directive n°2004-108 from the European Parliament and Council relative to electromagnetic compatibility
- European directive n°2006-95 from the European Parliament and Council relative to low voltage
- European directive n°92-42 relative to the yield of boilers

2.3.2 Local regulations

Benchmark places responsibilities on both manufacturers and installers. The purpose is to ensure that customers are provided with the correct equipment for their needs, that it is installed, commissioned and serviced in accordance with the manufacturer’s instructions by a competent person approved at the time by the Health and Safety Executive and that it meets the requirements of the appropriate Building Regulations. The Benchmark Checklist can be used to demonstrate compliance with Building Regulations and should be provided to the customer for future reference.

Installers are required to carry out installation, commissioning and servicing work in accordance with the Benchmark Code of Practice which is available from the Heating and Hotwater Industry Council who manage and promote the Scheme.

• Visit www.centralheating.co.uk for more information.

3 Safety instructions and regulations

3.1 Safety instructions

If the gas pressure at the input of the appliance is outside the range specified, the appliance must not be put into operation.

**DANGER:** Incorrect installation can cause electric shock or appliance damage.

- Never disable security devices and do not try to adjust them.

With regards to the “Manual Handling Operations, 1992 Regulations”, the appliance exceeds the recommended weight for a one person lift. The handling of the boiler may involve lifting, pushing and pulling, the use of a sack truck may be required.

- Be sure to consider the following handling techniques and precautions:
  - Grip the appliance at its base
  - Use safety clothing where appropriate, e.g. gloves, safety footwear.

- Ensure safe lifting techniques are used:
  - Keep back straight.
  - Avoid twisting at the waist.
  - Avoid upper body/top heavy bending.
  - Always grip using the palm of the hand.
  - Use designated hand holds.
  - Keep load as close to body as possible.
  - Always use assistance if required.

- Under no circumstances must the user interfere with or adjust sealed parts.

- When assembling the connections, correctly position the seals to avoid any leakage of gas or water.

- This appliance contains metal parts (components) and care should be taken when handling and cleaning, with particular regard to edges.

The basic safety instructions must be followed before attempting to maintain or replace spare parts:

- Stop the appliance.
- Electrically isolate the appliance from the power supply.
- Turn off the appliance gas isolation valve.
- Hydraulically isolate the appliance using the isolation valves if provided.
- Should you need to replace hydraulic components, drain the appliance.
- Protect all the electrical components from water while working on the appliance.

- Use only original spare parts.
- Use only new O-rings and gaskets.
- After having completed work on gas or water carrying components, check for their tightness.
- When work on the appliance is completed, perform an operational test and check for safety.

3.2 Regulations

3.2.1 Statutory requirements

**IMPORTANT**

Where no British Standards exists, materials and equipment should be fit for their purpose and of suitable quality and workmanship.

The installation of this boiler must be carried out by a competent person approved at the time by the Health and Safety Executive and in accordance with the rules in force in the countries of destination.

Manufacturer’s instructions must not be taken as overriding statutory requirements.

**Statutory Requirements**

In GB, the installation of the boiler must comply with the requirements of the current issue of BS6798 and be carried out by a competent person approved at the time by the Health and Safety Executive and as described in the following regulations:

- The manufacturer’s instructions supplied.
- The Gas Safety (Installation and Use) Regulations.
- The appropriate Buildings Regulations either The Building Regulations, The Building Regulations (Scotland), The Building Regulations (Northern Ireland).
- The Health and Safety at Work Act, Control of Substances Hazardous to Health (COSHH).
- Any electrical work must conform to BS7671 and part P of the building regulations where applicable.

Where no specific instructions are given, reference should be made to the relevant British Standard Code of Practice.

In IE, the installation must be carried out by a competent person approved at the time by the Health and Safety Executive and installed in accordance with the current edition of I.S.813 “Domestic Gas Installations”, the current Building Regulations and reference should be made to the current ETCI rules for Electrical Installation.

GB: the following Codes of Practice apply: BS4814, BS6798, BS5440 Part 1 and 2, BS5546 Part 1, BS5449, BS6891, BS6700, BS7074 Part 1 and 2, BS7593, BS7671.

IE: I.S.813, BS5546, BS 5449, BS 7074, BS 7593.

**NOTE:** For further information, see the current issue of the Building Regulations, approved document L1 (in the UK) and the following current issues of:

1) Central heating system specification (CheSS) and
2) Controls for domestic central heating system and hot water. BRECSU.
INTRODUCTION

Gas Supply

The gas installation must be in accordance with the relevant standards.

In GB, this is BS6891.
In IE, this is the current edition of I.S.813 “Domestic Gas Installations”.

The supply from the governed meter must be of adequate size to provide a steady inlet working pressure of 20mbar (8in wg) at the boiler. On completion, test the gas installation for tightness using the pressure drop method and suitable leak detection fluid, purge in accordance with the above standard.

Domestic Hot Water

All domestic hot water circuits, connections, fittings must be in accordance with the relevant standards and water supply regulations.

Heating System

In GB, it is necessary to comply with the Water Supply (Water Fittings) Regulations 1999 (for Scotland, the Water Byelaws 2000, Scotland). To comply with the Water regulations your attention is drawn to: The Water Regulations guide published by the Water Regulations Advisory Service (WRAS) gives full details of the requirements.

In IE, the requirements given in the current edition of I.S.813 “Domestic Gas Installations” and the current Building Regulations must be followed.

Electrical Supply

The boiler MUST be earthed. All system components shall be of an approved type and all wiring to current I.E.E. wiring regulations. External wiring must be correctly earthed, polarised and in accordance with the relevant standards.

In GB, this is BS 7671.
In IE, this is the current edition of ETCI rules.

The boiler MUST be connected to a permanent 230V ac, 50Hz supply.
Connection of the whole electrical system of the boiler, including any heating controls, to the electrical supply MUST be through one common isolator and must be fused 3 Amp maximum.

3.2.2 Other regulations

Control of Substances Hazardous to Health

Under Section 6 of The Health and Safety at Work Act 1974, we are required to provide information on substances hazardous to health. The adhesives and sealants used in this appliance are cured and give no known hazard in this state.

Insulation Pads:
These can cause irritation to skin, eyes and the respiratory tract. If you have a history of skin complaint you may be susceptible to irritation. High dust levels are usual only if the material is broken. Normal handling should not cause discomfort, but follow normal good hygiene and wash your hands before eating, drinking or going to the lavatory.
• If you do suffer irritation to the eyes or severe irritation to the skin seek medical attention.

4 Recycling

IMPORTANT:
The recycling of the packaging must be carried out by the qualified professional who installed the appliance.

4.1 Appliance

Most of the appliance is made of recyclable materials.

This symbol indicates that this appliance must not be disposed of with household waste, that it should be selectively collected for energy recovery, reuse or recycling.
• Take the appliance to an appropriate collection point.

IMPORTANT:
By complying with this directive, you will contribute to the preservation of natural resources and the protection of human health.

4.2 Packaging

We recommend that you recycle the packaging of the appliance in a responsible fashion.
• Sort the waste in order to separate those elements which can be recycled (cardboard, plastics ...) and those which cannot be recycled.
• Eliminate the waste in accordance with existing regulations.

6 Appliance location

6.1 Location

6.1.1 Instructions

Before choosing a site for the appliance, carefully read the safety warnings and installation manual.

• Ensure that wall to which the appliance will be mounted on is structurally safe in order to support the weight of the appliance.

• Ensure that the space that the appliance is to be installed within allows the appliance to be installed and the clearances maintained. This will ensure that the connections to the water, gas and flue can be accessed and inspected (see chapter Clearances).

• Explain these requirements to the appliance user.

• Do not install the appliance above another appliance that could damage it (for example, above a cooker that might emit steam or grease) or in a room, which has a lot of dust in the atmosphere which is corrosive.

• The boiler must be fitted inside the property and exposed pipe work may need to be protected from frost by fitting a frost thermostat.

6.1.2 Regulations

Location

This boiler is not suitable for outdoor installation. This boiler is suitable for installation in bathroom zones 2 and 3.

Timber Frame Buildings

If the boiler is to be installed in a timber frame building it should be fitted in accordance with the Institute of Gas Engineers document IGE/UP/7/1998. If in doubt seek advice from local gas undertaking or Glow-worm.

6.2 Clearances

• To allow periodic maintenance, ensure the distances indicated on the diagram.

Additional clearances may be beneficial around the boiler for installation and servicing.

For flue installations where external access is not practicable, consideration should be given for the space required to insert the flue from inside the property, which may necessitate clearance larger than those specified in diagram.

6.3 Ventilation

6.3.1 Room Ventilation

The boiler is room sealed so a permanent air vent is not required.

6.3.2 Cupboard or Compartment Ventilation

Due to the high efficiency and low casing temperature of this boiler, cupboard or compartment ventilation is not necessary.

• Existing ventilation should be investigated for its purpose before removing.
7 Appliance installation

7.1 Scope of delivery

The appliance is delivered in a single carton with a document pack and fittings.

**IMPORTANT:**
The flues package will be ordered according to the configuration of the installation.

- Please check the contents.

---

7.2 Recommendations before installing

7.2.1 Domestic hot water circuit design

**Water pressure**

The minimum working pressure to obtain the maximum domestic flow is 1.0 bar.

The maximum working pressure of the domestic hot water circuit is 10 bar. If the cold water supply pressure exceeds this, then a pressure-reducing valve must be fitted in the supply to the boiler.

**‘Hard’ water areas**

The temperatures within the heat exchanger are limited by the boiler control system to minimise scale formation within the hot water pipework. However, in areas where the water is ‘hard’ (i.e. more than 200 mg/L of calcium carbonate), it is recommended that the hot water setting is reduced and that a scale reducer is fitted, refer to the manufacturer’s instructions or consult the local water company for additional advice.

**Domestic water flow rate**

The domestic hot water flow has a restrictor, factory fitted, which reduces the flow to a maximum of:
- 24 : 8/min,
- 28 : 10/min,

**Central Heating water flow rate**

If it is necessary to alter the flow rate, the system can be fitted with a lockable balancing valve in the main flow or return pipes.

---

![Diagram of appliance installation](image-url)
**General**

This boiler is designed for use as part of a sealed water central heating system with fully pumped circulation. The pump, expansion vessel and associated safety devices are all fitted within the boiler.

**Safety valve**

The safety valve is an integral part of the boiler and it cannot be adjusted. The pipe from the safety discharge valve must discharge safely in accordance with standards.

**Expansion vessel**

The boiler has an integral expansion vessel with a capacity of 8 litres (1.76 gallons), with a charge pressure of 0.75bar.

**IMPORTANT:**
The heating system volume should be calculated to ensure that the expansion vessel is suitable, it may be necessary to add an additional vessel.

- In GB, Guidance on vessel sizing is also given in the current issue of BS5449 and BS7074 Part 1.
- In IE, current edition of I.S.813 "Domestic Gas Installations".

**Bypass**

The boiler is fitted with an automatic bypass.

- Ensure that under no circumstances does the flow rate drop below the figure specified, refer to chapter "Technical data".

**Filling the sealed system**

Suitable external filling systems are shown diagrammatically, see diagram below.

![Diagram of filling system](image)

**Key**

1. Heating flow circuit
2. Heating return circuit
3. Boiler
4. Double check valve assembly
5. Domestic cold water supply in
6. Temporary filling loop (remove immediately after filling)
7. Drain point

The system should be pressurised to 0.8bar, indicated on the digital display with no heating demand.

**Drain points**

Drain taps must be provided at all low points of the system, which will allow the entire system to be drained.

Drain taps shall be to the current issue of BS2879.

**Water treatment**

**Existing system:** It is essential that prior to installing the new boiler the system is thoroughly flushed.

**New system:** For optimum performance after installation, the boiler and its associated central heating system should also be flushed.

Flushing shall be carried out in accordance with BS 7593, a chemical cleanser can be used either Sentinel X300, X400 or Fernox F3 are suitable.

It is recommended to flush existing systems first before fitting the new boiler.

- Ensure all cleanser is removed from the whole system before adding an inhibitor.

For long-term corrosion protection after flushing, an inhibitor suitable for stainless steel heat exchangers can be used. Either Sentinel X100 or Fernox F1 inhibitor can be used.

The boiler is suitable for use on systems using softened water.

**7.3 Dimensions**

![Dimensions diagram](image)
7.4 Mounting

- Make sure that the equipment used for implementing the installation is compatible with that of the appliance.
- Determine the assembly location. See the "Appliance location" chapter.

7.4.1 Fixing to the wall

** Flue hole cutting

- Mark the position of the flue centre.
- Remove the wall template, then drilling the flue hole.

** IMPORTANT:**
The flue is designed with an internal fall of 44mm/metre (2.5°), therefore the hole can be drilled horizontally.

- Use a 105mm diameter core drill for external access flue installation (60/100 flue) (80/125 flue > Ø130mm).
- Use a 125mm diameter core drill for internal access only flue installation (60/100 flue) (80/125 flue > Ø150mm).

** IMPORTANT:**
If flue extension pipes are to be used then a core drill size of 125mm is required. This will allow the extension pieces to slope at 44mm/metre (2.5°) towards the boiler.

- If fitting a side flue, extend the flue centre line into the corner then 130mm along the adjacent wall.
- If fitting an extended side flue, determine the flue hole centre by extending the dashed inclined line on the template to the side wall. This dashed line is drawn at 44mm/metre (2.5°) rise from the boiler. Where this line reaches the side wall, a horizontal line should be marked. The vertical centre line of the flue should then be marked at 130mm from the back wall. To allow for the flue passing through the wall at this angle a 125mm hole should be drilled irrespective of internal or external installation.

** Hanging bracket fixing**

Due to the varied site conditions the fixings supplied may not be suitable, please make sure that those used are.

- Drill the holes for the fixing screws in accordance with the wall template.
- Fix the hanging bracket on the wall.
7.4.2 Boiler hanging

**DANGER:**
With regards to the Manual Handling Operations, 1992 Regulations, the following lift operation exceeds the recommended weight for a one person lift, refer to chapter "Manual Handling".

- Lifting the boiler into position, lean the top of the boiler slightly to the wall and position just above the hanging bracket.
- Lower the boiler slowly and engage onto the hanging bracket.

8 Hydraulic connection

8.1 Gas and water connections

The whole of the gas installation, including the meter, should be inspected, tested for tightness and purged in accordance with the current issue of BS6891 and in IE the current edition of I.S.813 "Domestic Gas Installations".

**IMPORTANT:**
The appliance may contain a small amount of water, place a water container beneath the boiler connections.

- Take care to clean the pipes before assembly removing any debris or burrs. Grease and oils may need to be removed they are not possible to remove by cleansing and flushing. Foreign bodies in the system may enter the appliance and interrupt its operation.
- Do not use any solvent products, due to the risk of damaging the circuit.

**DANGER:**
Do not perform any 'hot work' directly under the appliance, this may cause damage to the appliance base. Heat may also damage the isolation valves. Always pre-assemble pipes before fitting them to the boiler.

- Only use original seals supplied with the appliance.
- Check that there are no leaks. Repair if necessary.
- Check the cold water inlet filter is fitted (located in the appliance cold water inlet pipe).

**IMPORTANT:**
Before turning on the cold mains supply to the boiler turn off the cold water inlet to the boiler, lock the filling loop in the closed position and close its filling taps.
8.2 Safety Discharge Valve

Key
1 Discharge pipe 15mm o.d.
2 Pressure relief valve PRV
3 Draining outlet
A PRV outlet - to outside
B Appliance drain

This must be extended, using not less than 15mm o.d. pipe, to discharge, in a visible position, outside the building, facing downwards, preferably over a drain.

To ease future servicing it is advisable to use a compression type fitting to extend the safety discharge valve tube.

The pipe must have a continuous fall and be routed to a position so that any discharge of water, possibly boiling, or steam cannot create any danger to persons, damage to property or external electrical components and wiring.

8.3 Connection to the condensate trap

DANGER: Condensate produced by the appliance is mildly acidic (pH 3.5 - 5.0). Use protective gloves

ATTENTION: Condensate must only be discharged in accordance with these instructions.

IMPORTANT: The volume of condensates evacuated can reach about 15 litres per day for a detached house. This volume is negligible compared to the volume of waste water discharged by a house, because the condensates are diluted in this water.

- Refer to BS5546 and BS6798 for advice on disposal of boiler condensate.

Key
1 Condensate pipe
2 Condensate outlet pushfit

• Make sure there is no protective plug fitted.
• Connect the condensate pipe (1) to the condensate outlet (2).

IMPORTANT: The pipe should have a fall of at least 2.5° 44mm/metre away from the boiler.

Wherever possible, the condensate drainage pipe should be terminated into a suitable internal foul water discharge point such as an internal soil and vent stack, internal kitchen or bathroom waste pipe, washing machine waste pipe etc - ensuring that condensate drains away from the boiler under gravity.

Consideration must always be given to reducing the possibility of condensate pipes freezing and guidance must always be followed in the current BS 6798:2009. It is recommended to insulate external condensate pipes, any insulation must be vermin and peck-proof.

If it is unavoidable to run and terminate the condensate internally it is strongly advised to minimise the outside length of pipe and be of a minimum external diameter of 32 mm. Condensate pipes that pass through or from appliances installed in lofts, garages and basements should be treated as external pipes. Follow good installation practices and remove burrs from cut pipes and observe the recommended jointing method of the pipes and fittings. Note some installations may require the use of a condensate pump on order to achieve internal discharge.

**NOTE: PIPEWORK SHOULD ALWAYS FALL AWAY FROM BOILER BY AT LEAST 2.5° 44mm FOR EVERY 1M.**
9 Evacuation of combustion gas

9.1 Regulation

**ATTENTION:**
Only flue accessories supplied by Glow-worm must be used.

Different flue outlet configurations can be carried out.

- Consult your supplier for more information about the other possibilities and associated accessories.

- Standard flue terminal kits have an in-built fall back to the boiler to drain the condensate. These can be fitted level between the appliance and the termination position. All other extended flues must have a fall of at least 44mm/m.

The maximum length of the flue outlet is defined according to its type (for example C13).

- Whatever the kind of flue system chosen, observe the minimum distances indicated in the chart below to position the flue terminals.
- To install the flue, refer to the separate flue instruction supplied with your appliance.
- Explain these requirements to the user of the appliance.

**DANGER:**
If necessary, you must install a flue terminal guard.

**ATTENTION:**
Caution! The connection between the flue elbow and the flue outlet must be sealed.

In GB the minimum acceptable siting dimensions for the terminal from obstructions, other terminals and ventilation openings are shown in diagram overleaf.

In IE the minimum distances for flue terminal positioning must be those detailed in I.S.813 “Domestic Gas Installations”.

The terminal must be exposed to the external air, allowing free passage of air across it at all times.

Being a condensing boiler some plumbing may occur from the flue outlet. This should be taken into consideration when selecting the position for the terminal.

Carports or similar extensions of a roof only, or a roof and one wall, require special consideration with respect to any openings, doors, vents or windows under the roof. Care is required to protect the roof if made of plastic sheeting. A carport is defined as a roof and one wall.

---

**ATTENTION:**
If the flue terminal is positioned near a light source insects may enter the flue system. Where safe and practical to do so advise the homeowner to check the flue outlet and clear visible insects from the terminal end.

**UNDER CAR PORT etc.**

</tbody>
</table>

Refer to the Plume Management Kit installation manual.

9.2.2 Vertical concentric flue Ø 60/100 mm or Ø 80/125 mm (C33 type installation)

<table>
<thead>
<tr>
<th>Ø 60/100</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>Ø 60/100</td>
</tr>
<tr>
<td>Ø 80/125</td>
</tr>
</tbody>
</table>

Each time an additional 90° bend is necessary (or 2 at 45°), the length (L) must be reduced by 1 m.
9.2.3 Multiple boiler chimney flue
Ø 60/100 mm (C43 type installation)

ATTENTION:
The flue connecting from the appliance to the flue system must be supplied from the manufacturer of the boiler.

ATTENTION:
C43 flue systems must not be a 'pressurised system' but act under natural draught principles.

ATTENTION:
C43 type flue systems must have their own condensate drain fitted and not allow condensate to mix into other appliances.

![Diagram of the flue system]

</table>

Each time an additional 90° bend is necessary (or 2 at 45°), the length (L) must be reduced by 1 m.

10 Electrical connections

DANGER:
Incorrect installation can cause electric shock or appliance damage. The electrical connection of the appliance must be made only by a qualified engineer.

The appliance must be connected directly to an accessible, fixed, switched, electrical outlet.

The external wiring must be earthed, with correct polarity and in accordance with current standards.

The manufacturer declines any responsibility for damages to persons or others caused by the incorrect installation of the appliance earthing. This includes failure to comply with current standards.

Electrical components have been tested to meet the equivalent requirements of the BEAB.

• Do not use cable greater than 10 mm in diameter for the electrical connections.

All system components must be of an approved type.

• Do not interrupt the mains supply with a time switch or programmer.

The boiler is suitable for installation in bathroom zones 2 and 3.

10.1 Access to main board

![Diagram of the access to the main board]

Key
1 24 V access cover
2 Terminal blocks for 24 V connection
3 Terminal blocks for 230 V connection
4 230 V access cover
10.2 Main board

![Main board diagram]

Key
1  Connector
2  Electrical wires
3  Insulation

- Keep a distance of a maximum of 30 mm between connector (1) and the start of the insulation (3).
- Fix the cables in the cable-clamp on the eBox.

10.3 Electrical wiring

Connection of the whole electrical system and any heating system controls to the electrical supply must be through a double poled common switched and fused isolator.

The isolator shall have a contact separation of 3mm on each pole. It should be identified as to its use. Wiring to the boiler must be PVC 850C insulated cable not less than 0.75mm² (24/0.20).

A fused three pin plug and shuttered socket outlet may be used instead of a fused spur box provided that it is not used in a room containing a fixed bath or shower.

10.3.1 230V permanent supply

![230V permanent supply diagram]

Key
1  230V permanent supply
2  Main board terminal block
3  f use
4  Double pole connector

- Connect mains supply as described.

**DANGER:**
All cables connected to the appliance should be permanently fixed to the wall.

**IMPORTANT:**
This appliance will not operate without a link or system controls fitted.

- Connect the appliance's power cable to the 230 V single-phase network + earth.
- Observe correct polarity when connecting the appliance.
### 10.3.2 230V permanent supply + 230V system controls

**DANGER:**
All cables connected to the appliance should be permanently fixed to the wall.

**IMPORTANT:**
This appliance will not operate without a link or system controls fitted.

#### Key
1. 230V permanent supply
2. System controls
3. Frost stat
4. Main board terminal block
   - FP = Frost stat 230V (switchable)
   - RT = Switch live (230V)
   - = Mains earth
   - N = Mains neutral
   - L = Mains live
5. Junction box
6. Fuse
7. Double pole connector

- Connect the mains supply and system heating controls e.g. room thermostat as described.
- When installing a 230V controller, the link fitted to the 24V terminals (RT/24V) must be removed.

### 10.4 External accessories

**DANGER:**
Under no circumstances must any mains voltage be applied to any of the terminals on the 24V connection plug.

#### Key
1. 24V room thermostat connector
2. Ebus room thermostat connector or Ebus radio receiver
3. Outdoor sensor connector

- Fit external controls in accordance with the rules in force.
- When installing a non eBus controller, the link fitted to the 24V terminals (RT/24V) must be removed.

### 10.5 Testing the electrical connections

Carry out preliminary electrical system checks as below:
- Resistance to earth (≤1 Ohm)
- Short circuit test (L-N)
- Resistance to earth (L-E)
- Polarity check
10.6 Wiring diagram

Key

11 Commissioning

**IMPORTANT:**
At the time of commissioning, complete all relevant sections of the Benchmark Checklist located in the centre pages of this document.

The commissioning should be carried out by a competent person approved at the time by the Health and Safety Executive and in accordance with the current issue of BS6798.

11.1 Switching on

- Do not operate the boiler without water.
- Make sure that the system has been thoroughly flushed out with cold water and that all cleanser if used has been removed.
- With the gas service isolation valve closed, with no demand from any external controls and the power supply to the boiler switched off.
- Test for gas tightness and purge air from the gas supply.
- Switch on the power supply to the appliance.
- Make sure that the domestic hot water and heating functions on your appliance are not activated.

11.2 Filling the CH system (Central heating)

- Make sure that the installation’s cold water inlet isolating valve is open.
- Open the isolating valves located on the connections; they must be positioned in the direction of the flow.

If the (CH.) pressure falls below 0.4 bar, the display will flash the current pressure and the boiler will not operate. To increase the pressure, the CH circuit requires "Topping up".

**IMPORTANT:**
When turning the 230Vac supply on to the boiler should the water pressure be less than 0.5 bar an automatic air vent function will be activated for a period of 5 minutes. During this time the pressure should be increased and air vented from the system. Note that the burner will not fire in either the CH or DHW mode and the display will blink displaying the current water pressure.

- Vent air from each radiator until the water flows normally, then close the vents.
- Leave the pump’s air vent open.

**IMPORTANT:**
The following two operations will unblock the pump’s engine after a prolonged storage period and will purge the air from the pumps circuit.

- Remove the screw from the pump shaft and introduce a flat screwdriver. A trickle of water, under no pressure should normally come out of the pump.
- Rotate the pump’s shaft through several turns, then replace the screw.

11.3 Filling DHW Circuit

- Open the various hot water taps to fill the DHW circuit.

11.4 Filling the Condensate Trap

**Key**
1 Filling trap
2 Condensate trap
3 Screw for the pump shaft

- Fill the trap with water (1).
• Activate the Heating and Domestic Hot Water functions.
• Run the appliance for at least 15 minutes, with a heating temperature set to greater than or equal to 50°C (not applicable for an installation with underfloor heating).
• Vent air from each radiator again until the water flows normally, then close the vents.
• If you have difficulties in removing the air, launch the air-removal programs in the heating circuit (see the chapter "Technical settings for the appliance and list of parameters").
• Make sure that the pressure indicator shows a value of 0.8 bars; otherwise, fill the appliance again.

11.5 Initial lighting

11.5.1 Control

IMPORTANT:
The combustion for this appliance has been checked, adjusted and preset at the factory for operation on natural gas (G20) as defined on the appliance data label. No measurement of the combustion is necessary. Should the appliance require to be converted to LPG gas ensure you follow the gas conversion section before lighting the boiler.

• Check that the appliance has been installed in accordance with the instructions.
• Check the integrity of the flue system and flue seals.
• Check the integrity of the appliance combustion circuit and relevant seals.
• Check that all internal/external controls are calling for heat.
• Check that the gas service isolation is open.
• To adapt the appliance to another type of gas, see chapter "LPG conversion".

11.5.2 Adjusting the temperature

• Light the appliance following the procedure below.
• Select the "Heating + domestic hot water" function by pressing the “Mode” button repeatedly to scroll through your options until 🎉 is shown only.

The appliance will enter a self checking routine, then the fan will start and the ignition sequence commence. The boiler, if necessary, will automatically repeat the ignition sequence a further 4 times.

If the burner fails to ignite “F28” will be displayed, initially, this may be due to air in the gas supply line. Press the reset button. Do not use the reset button to purge the installation - never press reset more than 3 times.

• Select the heating function only by pressing the "mode" button repeatedly ( 🎉 is shown only).
• Press 📈 or 📉 buttons to adjust.
• Select the hot water function only by pressing the "mode" button repeatedly ( 🎉 is shown only).
• Press 📈 or 📉 buttons to adjust.
• Check that hot water is available at all taps, then close.
• Return the appliance to the correct mode by pressing "mode" button until the desired functions are activated.

11.6 Gas rates

The supply from the governed meter must be of adequate size to provide a steady inlet working pressure of 20mbar (8in wg) at the boiler.

• On completion, test the gas installation for tightness using the pressure drop method and suitable leak detection fluid, purge in accordance with the above standard.

IMPORTANT:
Due to the modulating operation of the boiler and the need to check the gas inlet pressure and measure the gas rate at maximum rate, it will be necessary to force it to maximum.

• Activate the test mode "P.01" and set the value to HI in order to force the burner at P. max. See chapter "Specific adjustment > Appliance technical settings and parameter list > Test modes".

11.6.1 Operational Gas Inlet Pressure

Key
1 Gas service isolation valve
2 Test point

• With all other gas appliances operating, check the operational supply pressure at the gas service isolation valve test point.

The nominal supply pressure for Natural Gas (G20) is 20mbar. The nominal supply pressure for LPG (G31) is 37mbar.

• Turn the taps and appliances off, then disconnect the pressure gauge.

Additionally the safe nominal maximum heat input of the appliance can be achieved at an inlet pressure down to 15mbar.

IMPORTANT:
The burner pressure cannot be measured and is not used to measure the gas rate.
11.6.2 Gas Rate

- Make sure that all other gas burning appliances and pilot lights are off.
- Check the gas rate using the gas meter test dial and stop watch, at least 10 minutes after the burner has lit, see table below for approximate rates.

<table>
<thead>
<tr>
<th>Model</th>

<td>2.96</td>
<td>104.05</td>
</tr>
</tbody>
</table>

Gas rates (G20) * (approx) after 10 mins from cold

Gas rates (G31) *

In communal or LPG installations where the gas rate cannot be measured it is acceptable to measure the combustion rate as described in the servicing section.

- On completion, press the "reset" button to reset the boiler.
- Gas rates for both central heating and hot water can be verified using the test program P.03 and P.01 respectively.

11.7 Testing heating system

- Ensure that the external controls and programmer are calling for heat.
- Fully open all radiator valves, see chapter "Appliance installation > Recommendations before installing > Heating circuit design".
- Activate the C.H. function on the appliance's control panel.
- Balance the radiators as required to give the required system differential.
- Turn off all radiators that can be shut off by the user and check to see if less than the maximum differential allowed of 20°C can be achieved across flow and return.

**IMPORTANT:**
Should the appliance require adjustment refer to the "Specific adjustment" section overleaf.

- Allow the system to reach maximum temperature then switch off the boiler by isolating from the electrical supply.
- Drain the entire system rapidly whilst hot, using the drain taps at all the low points of the system. Fill and vent the system as described previously in chapter "Commissioning > Filling the CH system (Central heating)".
- Adjust the boiler temperature controls and any system controls to their required settings.

11.8 Testing domestic hot water system

- Open a hot-water tap.
- Check that the temperature obtained is compliant with the setting on the appliance.

11.9 Completion

- Ensure that the magnetic lighting instruction label is placed on the surface of the boiler casing.

GB: It is a requirement that the “Benchmark” Installation, Commissioning and Service Record is completed and left with the user.

IE: It is necessary to complete a “Declaration of Conformity” to indicate compliance to I.S.813. An example of this is given in the current edition of I.S.813.

12 Specified Adjustment

12.1 Heating circuit adjustment

By pass operation is automatic and not adjustable.

- If necessary, fit an external by-pass.

12.2 Installation settings

• Push in and hold the (mode) button for more than 7 seconds to access the configuration menu. The screen displays "0".

• Press the (on) button 4 times. The screen displays "96". This is the installer’s password.

• Press (mode) to validate. The screen displays a flashing and alternating "d." and "00".

• Press (on) or (off) button to access the parameter to modify.

• Press (mode) button to modify the value of the parameter and select with the (on) or (off) keys.

• Press (mode) button to confirm and save the changes.

• Press and hold the (mode) button for more than 7 seconds to exit.

12.5 Test modes

By activating these various test modes, you can enable special functions on the appliance.

• Press the on/off button to switch off the appliance.
• While keeping the button pressed for more than 5 seconds, press the on/off button. The screen displays the first test mode "P1" and "Off".
• Press or button to choose the test mode that you wish to launch.
• Test mode "P1" :
  - Press button to display the burner forcing setting. The screen displays "P1" and "Lo".
  - Press or button to modify the value of the setting from "Lo" (0%) to "Hi" (100%).
  - Press on button for 1 second to exit the submenu or for more than 7 seconds to access the configuration menu.
• Test mode "P.02" to "P.07" :
  - Press to launch the test mode. The screen displays "PX" and "On".
  - The test mode will be automatically stop after 15 minutes.
• When you have finished, press the reset button to exit the test modes.

12.6 CO₂ measurement

The combustion for this appliance has been pre-set at the factory for operation on Natural Gas G20 as defined on the appliance data label.

No adjustment of the combustion is necessary.

If you wish to check the combustion then follow the instructions in the Servicing section.

12.7 Re-check and restart

• Once the appliance is installed, check the operation of the appliance.
• Start the appliance to ensure that any adjustments operate correctly and check that the appliance operates safely.
• Check the gas-tightness and water-tightness of the appliance and eliminate any leaks.
• Check that the flue joints are tested for tightness and fitted in accordance with the instructions.
• Check the entire control and safety system, its settings and its operation.

13 User information

At the end of the installation, the installer must:

• explain the operation of the appliance and its safety devices to the user, if necessary provide a demonstration and answer any questions;
• hand over to the user all the required documentation;
• advise the user of the precautions necessary to prevent damage to the system, appliance and the building;
• remind the user to service the appliance annually.
• Draw attention, if applicable, to the current issue of the Gas Safety (Installation and Use) Regulations, Section 35, which imposes a duty of care on all persons who let out any property containing a gas appliance in the UK.

The user shall not interfere with or adjust sealed components. It is the Law that any servicing is carried out by a competent person approved at the time by the Health and Safety Executive.

• Advise the user that, like all condensing boilers this appliance will produce a plume of condensation from the flue terminal in cool weather. This is due to the high efficiency and low flue gas temperature of the boiler.

• Advise the user that the permanent mains electrical supply should not be switched off, as the built in frost protection and pump exercise program will not operate.

• Advise the User if the mains electricity and gas are to be turned off for any long periods during severe weather, it is recommended that the whole system, including the boiler, should be drained to avoid the risk of freezing.

***IMPORTANT:

Sealed system: The system must be refilled and to the correct pressure as indicated in these instructions

• Leave these instructions and the 'Benchmark' Installation, Commissioning and Service Record with the user.
MAINTENANCE

To ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced at regular intervals. The frequency of servicing will depend upon the particular installation and usage, but in general once a year should be enough.

It is the Law that any servicing is carried out by a competent person approved at the time by the Health and Safety Executive.

• Before commencing with a service or replacement of parts isolate the boiler from the electrical supply and turn off the gas supply at the gas isolation valve.

• When replacing a part on this appliance, use only spare parts that you can be assured conform to the safety and performance specification that we require. Do not use reconditioned or copy parts that have not been clearly authorised by Glow-worm.

• If any electrical connections have been disconnected and after their connection, checks to the earth continuity, polarity, short circuit and resistance to earth must be repeated using a suitable multimeter, as described in chapter “Trouble-shooting > Fault diagnosis > Check the electrical installation”.

• After servicing, complete the relevant Service Interval Record section of the Benchmark Checklist located in the back pages of this document.

14 Trouble-shooting

14.1 Fault diagnosis

The following checks should be performed before proceeding onto specific diagnostics:

• Make sure that the electricity supply has not been interrupted and that the appliance is connected correctly (See chapter “Trouble-shooting > Fault diagnosis > Check the electrical installation”)

• Check the appliance’s gas supply (See chapter “Trouble-shooting > Fault diagnosis > Check the gas supply”).

• Ensure that the isolating valves are open.

• Ensure that the pressure indicator displays a value of 0.8 bar (if the pressure falls below 0.4 bar, the air vent function will run automatically for a period of 5 minutes until you see 0.5 bar on the pressure indicator). If not, fill the appliance.

• Check that all external controls are connected correctly.

• If the symbol is displayed on the screen, display the fault code memory (see chapter "Trouble-shooting > Fault memory").

• Press the reset button to restart the appliance.

• Check the functional flow diagram.

14.1.1 Check the electrical installation

Key
1 Main board
2 Neutral
3 Live
4 Multimeter

• Remove the front casing panel

• Check the external electrical supply to the boiler is on and a supply of 230V is present at the ‘L’ and ‘N’ terminals on the main board.

• Check the electrical installation and appliance, carry out tests for earth continuity, polarity, short circuit and resistance to earth, using a suitable multimeter.

• Bare metal points such as screws or rivets will act as suitable earth check points on the appliance.

14.1.2 Check the gas supply

Key
1 Gas service isolation valve
2 Test point

• Check that there is a gas supply to the boiler and the gas service isolation valve is turned on.

• Check pressure at the gas service isolation valve.
14.2 Fault memory

- This menu allows you to display the 10 most recent failure codes registered by the appliance.
- In order to display the fault code memory, simultaneously press the buttons \( \oplus \) and \( \ominus \) for more than 7 seconds.
- The screen will display the first fault “1.” (record) and after “XX” (fault code).
- To display the other faults registered by the appliance, press the button \( \oplus \) or \( \ominus \).
- Press button \( \text{mode} \) for more than 3 seconds to exit this menu.
- To erase the fault memory registered by the appliance, consult the “Installation adjustments” chapter and use code “d.94”.

14.3 Fault codes

**IMPORTANT:**
The faults described in this chapter should be carried out by a qualified engineer and if needed by the After Sales Service.

15 Gas conversion adjustments

In order to operate with a gas other than that provided from the factory, it is necessary to make some adjustments to the gas valve.

This conversion should only be carried out by a competent person approved at the time by the Health and Safety Executive.

- During the conversion to Propane, use of a suitable flue gas analyser is necessary.

The person carrying out a combustion measurement should have been assessed as competent in the use of a flue gas analyser and the interpretation of the results.

The flue gas analyser used should be one meeting the requirements of BS7927 or BS-EN50379-3 and be calibrated in accordance with the analyser manufacturers’ requirements.

Competence can be demonstrated by satisfactory completion of the CPA1 ACS assessment, which covers the use of electronic portable combustion gas analysers in accordance with BS 7967, parts 1 to 4.

15.1 Settings

**IMPORTANT:**

Steps "Switching on" to "Re-pressurising System" will need to be completed before the appliance can be converted (See chapter "Commissioning").

To make the conversion are a 4mm Allen key and an electricians screwdriver.

Having checked:

- the appliance and system have been installed in accordance with the instructions.
- the integrity of the flue system and flue seals....
- the integrity of the appliance combustion circuit and relevant seals....
- that all internal/external controls are calling for heat.
- the gas service isolation valve is opened.

<td>Cap</td>
</tr>
</tbody>
</table>

15.1.1 Adjusting the gas valve

- Press the on/off button to turn the appliance off.
- Turn the screw in the direction and the number of times indicated in the following table.

<table>
<thead>
<tr>
<th>Gas adjustment Model</th>
<th>G20 &gt; G31</th>
<th>G31 &gt; G20</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>2 turns</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td>3.5 turns</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td>2 turns</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td>3.5 turns</td>
<td></td>
</tr>
</tbody>
</table>
15.1.2 Adjusting the maximum power setting

- Activate the test mode “P.01” and set the value to HI in order to force the burner at P. max. See chapter "Specific adjustment > Appliance technical settings and parameter list > Test modes”.
- Wait approximately 5 minutes to read a stabilized CO₂ value.
- Compare the value measured with the values indicated in the table below.

<table>
<thead>
<tr>
<th>Gas adjustment</th>
<th>G20</th>
<th>G31</th>
</tr>
</thead>
<tbody>
<tr>
<td>CO₂, case ON</td>
<td>9 ± 0.2 %</td>
<td>10.1 ± 0.2 %</td>
</tr>
<tr>
<td>CO₂, case OFF</td>
<td>9.2 ± 0.3 %</td>
<td>10.3 ± 0.3 %</td>
</tr>
</tbody>
</table>

**IMPORTANT:**
Safe combustion can only be verified by measuring CO/CO₂ ratio. This must not exceed the value shown in the table under the section “Maximum Rate and Adjustment”.

15.1.3 Restarting

- Replace the cap
- Replace the appliance front panel.

Note: following the replacement of the front panel, the CO₂ value will change: you can check that the value “case on” is correct by the values in the previous table.

16 Draining

16.1 Heating circuit

- Drain down the heating circuit of the boiler only, by closing the heating flow and return isolating valves. See chapter "Hydraulic connection > Gas and water connections”
- Open the drain point (2). Attach a length of hose (1) if required.
- After draining, close the drain valve (2) and remove the hose.

16.2 Domestic Hot water circuit

- Drain the Domestic Hot Water circuit by closing the cold-water isolation valve.
- Open one or more hot water taps to drain the hot water circuit.

17 Servicing

- To ensure the continued efficient and safe operation of the boiler it is recommended that it is checked and serviced as necessary at regular intervals.

The frequency of servicing will depend upon the particular installation conditions and usage. However it is recommended that the boiler is inspected as part of a service at least once a year.

If this appliance is installed in a rented property there is a duty of care imposed on the owner of the property by the current issue of the Gas Safety (Installation and Use) Regulations, Section 35.

- Servicing/maintenance should be carried out by a competent person approved at the time by the Health and Safety Executive in accordance with the rules in force in the countries of destination.
To obtain service, please call your installer or Glow-worm’s own service organisation.

PLEASE NOTE: During routine servicing, and after any maintenance, we recommend that the following must be checked:
- The integrity of the flue system and the flue seals,
- The integrity of the boiler combustion circuit and the relevant seals,
- The operational (working) gas inlet pressure at maximum rate,
- The gas rate,
- The combustion performance.
- See the “Safety instructions” chapter for a list of operations to be performed prior to the maintenance of the application.
- Once the maintenance operations have been completed, consult the “Start Up” chapter to restart the appliance.

17.1 Annual Maintenance

17.1.1 Verification of components
- Check that the flow sensor is working properly.
  See chapter “Specific adjustment > Appliance technical settings and parameter list > Installation settings” and use code “d.36”.
- Check that the fan is working properly.
  See chapter “Specific adjustment > Appliance technical settings and parameter list > Installation settings” and use code “d.34”.
- Check that the temperature sensors are working properly.
  See chapter “Specific adjustment > Appliance technical settings and parameter list > Installation settings” and use code “d.3, d.4, d.40, d.41”.
- Check the ionisation quality.
- Check that the thermal fuse protects the appliance against dry fire. Disconnect the thermal fuse and check if “F76” fault code is displayed on the screen.
- Check that the pressure sensor is working properly. The pressure must be displayed on the screen.
- Check the pressure of the expansion vessel.

17.1.2 Other checks
- Check the CO₂ rate in the fuel and compare with the values indicated in the chapter “CO₂ Measurement”.
- Check that there are no leaks in the joints and the safety valves.
- Check that there are no gas leaks.
- Verify that the flue system is sound and complete.
- Check the appliance’s electrical safety.

17.1.3 Cleaning of the components
- Clean the following components:
  - The condensate trap
  - The heat exchanger.
  - The burner
  - The fan

17.1.4 Corrosion and anti-sludge protection
In order to avoid corrosion, the addition of a corrosion inhibitor to the heating circuit water is recommended. The inhibitor will stop electrolytic reaction and bacterial growth between the different metals used in the installation.

It will also avoid the formation of gas which could be produced following the chemical reactions.

It is especially important to treat the water in underfloor heating systems, as low temperatures favour bacterial growth. This can lead to the formation of sludge, which in turn may block some or all of the circuits.

In order to add the correct dosage of these products, you must know the volume of water contained in the installation. It is recommended that you note down the volume for future needs.

The inhibitors must be compatible with the materials employed in the installation.

17.2 Casing removing

17.2.1 Front panel

Key
1 Front panel
2 Front panel retaining screw

- Undo the two screws (2) on the underside of the front panel and remove the front panel (1).
17.2.2 Control box

Key
1 Control box

- Position the control box (1) into the service position.

17.3 Combustion check and setting the air/gas ratio valve

17.3.1 Competency to carry out the check of combustion performance

**IMPORTANT:**

BS 6798: 2009 Specification for installation and maintenance of gas-fired boilers of rated input not exceeding 70kW net advises that:

- The person carrying out a combustion measurement must be assessed as competent in the use of a flue gas analyser and the interpretation of the results.
- The flue gas analyser used should be one meeting the requirements of BS7927 or BS-EN50379-3 and be calibrated in accordance with the analyser manufacturers’ requirements.
- Competence can be demonstrated by satisfactory completion of the CPA1 ACS assessment, which covers the use of electronic portable combustion gas analysers in accordance with BS 7967, parts 1 to 4.
- Ensure that the gas analyser is set to the correct fuel setting.
- Select the “+” button, constant central heating with DHW function by pressing the “mode” button repeatedly, refer to commissioning section. The boiler should fire automatically.

**IMPORTANT:**

Safe combustion can only be verified by measuring CO/CO₂ ratio. This must not exceed the value shown in the table opposite.

17.3.2 Preliminaries

Prior to, during servicing and after any maintenance or changed parts, the following inspection must be carried out.

- The integrity of the flue system and flue seals.
- The integrity of the appliance combustion circuit and relevant seals.
- A visual inspection of the flame quality.

- Electrical, gas and water connections.
- System pressure.
- The combustion performance, refer to the following procedure.
- The operational gas inlet pressure and gas rates, refer to the commissioning section paragraph 12.5. Correct any fault before continuing.

**Combustion check and setting the air/gas ratio**

- Remove the front casing panel and hinge down the control box. Taking care not to touch any internal components, proceed as follows:
- Connect the CO₂ combustion analyser to the relevant test point.

<table>
<thead>
<tr>
<th>G20 Burner % CO₂</th>
<th>Model</th>
<th>Check (case on)</th>
<th>Setting (case off)</th>
<th>CO/CO₂ ratio</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>24</td>
<td>9.2 ± 0.3%</td>
<td>9 ± 0.2%</td>
<td>0.004</td>
</tr>
<tr>
<td></td>
<td>28</td>
<td>9.2 ± 0.3%</td>
<td>9 ± 0.2%</td>
<td>0.004</td>
</tr>
</tbody>
</table>
If the combustion reading is not within the acceptable values and the integrity of the complete flue system and combustion circuit seals have been verified and the inlet gas pressure (and gas rate) have been verified, then, it will necessary to adjust the combustion rate of the appliance.

**IMPORTANT:**
Adjustment is made by turning the throttle an ⅛ of a turn, waiting 1 minute to allow the appliance to stabilise before checking or making further adjustments.

- Remove the sticker covering the “throttle” adjustment screw, if fitted.
- Rotate the “throttle” (1) (anti-clockwise to increase), to the required CO\textsubscript{2}, refer to previous diagram and the “Setting” column in the table.
- When you have finished, press the On/Off button to exit the test modes.
- Remove the analyser probe and replace the cap on the sampling point, replace the controls fascia, and the front casing panel.

**IMPORTANT:**
Remember to replace the sample point cap on completion of the test.

17.3.4 Gas rate check

- Check the gas rates as described in the commissioning section.

17.3.5 Completion

If it is not possible to achieve the required results for either the combustion or gas rates, it will be necessary to complete a full service of the appliance and then repeat the combustion check procedure. If after servicing and adjustment of the appliance the combustion values are still unacceptable and after further remedial work has been carried out, the appliance must be disconnected until the CO/CO\textsubscript{2} ratio is acceptable.

- Advice can be sought from the Glow-worm Technical Helpline.

### G31 Burner % CO\textsubscript{2}

<table>

<td>0.004</td>
</tr>
</tbody>
</table>

All routine servicing requirements can be achieved by the removal of the front panel.

- Position the control box into the service position.
- Before commencing with a service or replacement of parts, isolate the boiler from the electrical and gas supplies.

17.4.1 Service interval record

- Refer to benchmark Service Interval Record at the rear of this manual.

17.5 Silencer

- Remove the silencer retaining screws (1) and remove the silencer (3).
- Clean the interior of the silencer with a dry cloth if necessary, taking care not to damage the internal foam.
- Repeat the operation in reverse order to replace the silencer.
17.6 Expansion vessel

- Check the expansion vessel's supply pressure (see « Technical Data » chapter) by means of the pressure inlet located on the expansion vessel. Adjust the pressure if necessary.

- Following the installation of a new expansion vessel, fill and purge the appliance or installation, if necessary.

17.7 Condensate trap

**Warning:**
condensate is mildly acidic. Use protective gloves.

- Place a container under the condensate trap (5).
- Remove the condensate from the reservoir (1).
- Disconnect the condensation discharge (2).
- Disconnect the heat exchanger hose (6).

The condense trap will contain water, lift taking care not to spill the water.

- Remove the condensate trap (5) using the retaining screw (4).
- Clean the hose, the trap and the siphon, remove any accumulated dirt.
- Reassemble the components, taking care to position the gaskets correctly.
- Start the siphon (3) and fill with water.
17.8 Combustion block

17.8.1 Spark electrode

- Disconnect the electrode inlet (3) and the grounding cable (2).
- Remove the 2 spark electrode retaining screws (4).
- Carefully remove the electrode from the combustion chamber.
- Check that the extremes of the electrode (6) are not damaged.
- Clean away any accumulation of dirt and check that the distance between the two electrodes is between 3.5 and 4.5 mm.
- Check that the gasket (5) is not damaged. Replace if necessary.
MAINTENANCE

17.8.2 Dismantling the burner

**Warning:**
The burner door seal (12) must be replaced each time the burner is dismantled.

- Disconnect the spark electrode connector (6) from the igniter unit.
- Remove the gas pipe (17).
- Remove the connectors from the gas valve (1) and the fan (15).
- Remove the retaining screw of the silencer.
- Loosen the 4 nuts (7).
- Remove the burner group from the heat exchanger (11).
- The studs (8) fixed to the heat exchanger must not be damaged. Should it be damaged, replace the heat exchanger.
- The burner gate insulation should not be damaged. Replace if damaged.

17.8.3 Cleaning the heat exchanger

- Clean the coil (19) in the heat exchanger (11) with water.

17.8.4 Burner control

- The burner (13) does not require maintenance and should not be cleaned.
- Check that its surface is not damage. Replace the burner if necessary.
- Following the verification or replacement of the burner, assemble the burner group as described in the following chapter.

17.8.5 Re-assembling the burner group

- Place the burner group on the heat exchanger (11).
- Progressively tighten the 4 nuts (7) in an alternate order.
- Reassemble the silencer.
- Connect the gas tube (17) with a new gasket to the burner group.
- Connect the spark electrode connector (6) to the igniter unit.
- Connect the connector to the gas valve (1) and the fan (15).
- Open the appliance gas input.
- Check the watertightness of the gas connection.

17.9 Service completion

- Re-check the combustion, see chapter "Combustion check".

On completion of the service, the "Benchmark" Service Record should be completed.

18 Replacement of Parts

- Do not use reconditioned or copy parts, only use original parts supplied by Glow-worm.
- If a part is required, contact the Glow-worm service organisation.
- Please quote the name of the appliance, this information will be on the name badge on the front of the appliance.
- If in doubt seek advice from the local gas company or Glow-worm's own service organisation.

**DANGER:**
Replacement of parts must be carried out by a competent person approved at the time by the Health and Safety Executive.

PLEASE NOTE: During change of part of the combustion circuit, we recommend that the following is the following must be checked:
- The integrity of the flue system and the flue seals,
- The integrity of the boiler combustion circuit and the relevant seals,
- The operational (working) gas inlet pressure at maximum rate,
- The gas rate,
- The combustion performance.

18.1 General

**ATTENTION:**
The replacement of parts described in sections "Combustion block" will require the removal of the burner module assembly and the replacement of seal and self locking nuts.

Replacement parts that have associated components that need to be replacing on removal, i.e. ‘O’ ring, seals, gasket, etc., will be supplied and should be fitted.

- Before replacing any parts of the boiler, isolate from the mains electric supply and turn off the gas at the gas service isolation valve on the boiler.

Unless stated otherwise parts are replaced in the reverse order to removal.

- After replacing any parts, always test for gas tightness and if necessary carry out functional test of the controls.

18.2 Boiler Access

For replacement of parts, the front casing panel of the boiler will need to be removed.

- To remove undo the two screws on the underside of the front casing and lift off.
18.3 Viewing window

Key
1 Fibre washer
2 Steel washer
3 Glass
4 Steel washer
5 Circlip

- Remove the circlip (5).
- Remove the steel washer (4).
- Remove fibre washer (1).
- Remove the glass (3).

18.3.1 Expansion vessel

Key
1 Connector
2 Expansion vessel
3 Upper support bracket
4 Retaining screw
5 Gasket

Drain the boiler heating circuit as described in the appropriate chapter "Draining".

- Remove the two screws (4).
- Undo the connector (1) at the base of the vessel.
- Remove upper support bracket (3).
- Remove the expansion vessel (2).
- Fit a new gasket between the expansion vessel and connector.
- Refill, vent and pressurise the boiler.
18.4 Hydraulic block

Key
1 Three-way valve
2 Three-way valve electrical plug
3 Three-way valve electrical plug retaining clip
4 Low water pressure sensor connector
5 Low water pressure sensor
6 Low water pressure sensor retaining clip
7 Heating flow pipe retaining clip
8 Heating flow pipe
9 Heating flow pipe
10 Heating flow pipe retaining clip
11 Gas pipe
12 Flow sensor electrical plug
13 Flow sensor
14 Heating return pipe
15 Expansion vessel pipe
16 Plate-to-plate heat exchanger
17 Automatic air vent
18 Expansion vessel pipe clip
19 Automatic air vent retaining clip
20 Pump head retaining screws
21 Pump housing
22 Pump head connector
23 Plate-to-plate heat exchanger retaining screws
24 Safety Discharge Valve
25 Bypass Valve
26 Bypass Valve retaining nut
27 Bypass Valve retaining nut
28 Impeller housing
29 Safety discharge valve plastic housing
30 Retaining clip

18.4.1 Pump (head only)

- Drain the boiler heating circuit as described in the appropriate chapter "Draining".
- Disconnect the electrical plug (22) from the main board.
- Remove the four cap head screws (20).
- Carefully remove the pump head (21) together with cable. Do not strain cable.
- Reconnect wiring to new pump head and fit cover.
- Fit the new pump head by repeating the operations in reverse.
18.4.2 Automatic air vent
- Drain the boiler heating circuit as described in the appropriate chapter "Draining".
- Remove the retaining clip (19). Remove the automatic air vent (18).
- Fit the new automatic air vent and ‘O’ ring ensuring the vent cap is left loose.
- Refill, vent and pressurise the boiler.

18.4.3 Low water pressure sensor
- Drain the boiler heating circuit as described in the appropriate chapter "Draining".
- Disconnect the electrical lead (4).
- Remove the retaining clip (6), remove the low water pressure sensor (5).
- Fit the new low water pressure sensor.
- Refill vent and pressurise the boiler.

18.4.4 Safety discharge valve
- Drain the boiler heating circuit as described in the appropriate chapter "Draining".
- Remove the low water pressure sensor as described in the previous section.
- Undo the safety discharge valve union and remove the pipe.
- Disconnect the Central Heating isolation valve.
- Remove the securing clips and withdraw the safety discharge valve plastic housing (29).
- Remove the safety discharge valve.
- Fit new ‘O’ ring. Refill, vent and pressurise the boiler.

18.4.5 Flow sensor and impeller
- Remove the electrical connection (12).
- Unclip the flow sensor (13).
- Unscrew the impeller housing (28) and remove the impeller.

18.4.6 Bypass
- Drain the boiler heating circuit as described in the appropriate chapter "Draining".
- Remove the bypass valve retaining nut (26) to remove the bypass from its housing (25).
- After replacing the bypass, refill, vent and pressurise the boiler.

18.4.7 3 way valve motor and diverter valve
- Drain the boiler heating circuit as described in the appropriate chapter "Draining".
- Disconnect the electrical plug (2).
- Remove the retaining clip (3).
- Remove the three way valve motor (1).
- Remove the diverter valve retaining nut.
- Remove the diverter valve.
- Fit new three way valve motor and diverter valve assembly.
- Refill, vent and pressurise the boiler.

18.4.8 Plate-to-plate heat exchanger
- Drain the boiler heating and domestic hot water circuits as described in the appropriate chapter "Draining".
- Remove the two securing screws (23).
- Remove the plate-to-plate heat exchanger (17).
- When replacing the plate-to-plate heat exchanger, ensure that the four rubber sealing washers are fitted into the hydroblock.

NOTE: The plate-to-plate heat exchanger only fits one way.
- Refill, vent and pressurise the boiler.
18.5 Combustion block

Legend
1 Igniter unit retaining bracket
2 Igniter unit
3 Igniter unit retaining screw

33 Fan
34 Fan electrical connection
35 Fan/burner gasket
36 Gas pipe
37 Gas valve electrical connection
38 Fan retaining screw
18.5.1 Spark electrode

- Disconnect the electrode cap (7) and the earthing cable (6).
- Remove the 2 spark electrode retaining screws (8).
- Carefully remove the electrode (10) from the combustion chamber.
- Remove the gasket (9).
- Check that the distance between the 2 electrodes is between 3.5 and 4.5 mm.
- Install the electrode and a new gasket.

18.5.2 Igniter unit

- Remove the ignition lead (2).
- Remove electrical connections (4).
- Loosen the screws (3) located on the igniter unit (2).
- Remove the igniter unit (2).

18.5.3 Removing the combustion/burner door assembly

ATTENTION:
The burner door seal (13) must be replaced each time the combustion/burner door assembly is removed.

- Disconnect the spark electrode cap (7) from the igniter unit.
- Disconnect the gas supply pipe (36) at the gas valve.
- Remove the electrical connectors from the gas valve (37) and the fan (34).
- Remove the retaining screw of the silencer.
- Loosen the 4 nuts (12).
- Remove the combustion/burner door assembly from the heat exchanger (11).
- The studs (19) must not be damaged. If damaged you will need to replace the heat exchanger.
- The combustion/burner door assembly insulation should be inspected and replaced if damaged.

18.5.4 Burner

- Remove the 3 burner retaining screws (16).
- Remove the burner (15) and the gasket (14).
- Fit the new burner and the new gasket.

18.5.5 Heat exchanger

ATTENTION:
There will be water in the heat exchanger. Carefully ease heat exchanger out.

- Drain the boiler heating and hot water circuits as described in the appropriate chapter "Draining".
- Remove the flue connection.
- Undo the two screws located on the top of each side panel.
- Remove the thermal fuse connector (20).
- Remove the 2 heating pipe retaining clips (25) and (29).
- Release the heating pipes (24) and (27) from the heat exchanger.
- Release the condensate trap pipe from the heat exchanger.
- Remove the combustion/burner door assembly (11) referring to chapter "Removing the combustion/burner door assembly".
- Unscrew the 4 retaining screws (17) and (23) and remove the 2 retaining plates (18) and (22) from the heat exchanger.
- Pull the heat exchanger towards you to extract it from its 2 side rails.

18.5.6 Re-assembling the burner group

- Place the burner assembly on the heat exchanger (21).
- Progressively tighten the 4 nuts (12) in an alternate order.
- Reassemble the silencer.
- Connect the gas pipe (36) with a new gasket to the burner group.
- Connect the spark electrode connector (5) to the igniter unit.
- Connect the connector to the gas valve (37) and the fan (34).
- Open the appliance’s gas input.
- Check the tightness of the gas connection.

18.5.7 Heating Flow Thermistor

- Remove the electrical connections from the thermistor (28).
- Remove the retaining clip from the flow pipe (27).

IMPORTANT:
When reconnecting, the polarity of the wiring to thermistors is not important.

18.5.8 Heating Return Thermistor

- Remove the electrical connections from the thermistor (26).
- Remove the retaining clip from the return pipe (24).

IMPORTANT:
When reconnecting, the polarity of the wiring to thermistors is not important.
18.5.9 Gas valve

- Remove the burner door (11) referring to chapter “Dismantling the burner door”.
- Remove the two gas valve retaining screws (30).
- Remove the gas valve (31) and the gasket (32).
- Fit the new gas valve and the new gasket by repeating the operations in reverse.
- After assembly test for gas tightness and purge in accordance with the current issue of BS6891 or in IE, the current edition of I.S.813 “Domestic Gas Installations”.
- Check the combustion CO₂.

18.5.10 Fan

- Remove the burner door (11) referring to chapter “Dismantling the burner door”.
- Remove the gas valve (31) (see previous paragraph).
- Loosen the 3 screws (38) located on the burner door (11).
- Remove the fan (33) and the gasket (35).
- Fit the new gasket (35).
- Screw the new fan to the burner door (11).
- After assembly test for gas tightness and purge in accordance with the current issue of BS6891 or in IE, the current edition of I.S.813 “Domestic Gas Installations”.

18.6 Condensate trap

ATTENTION:
Condensate is mildly acidic. Wear protective gloves.

- Place a container under the condensate trap (5).
- Remove the condensate from the reservoir (1).
- Disconnect the condensation discharge (2).
- Disconnect the heat exchanger hose (6).
The condensate trap will contain water, lift taking care not to spill the water.
- Remove the condensate trap (5) using the retaining screw (4).
- IMPORTANT: Partially fill the condensate trap with water before replacing. Start the siphon (3) and fill with water.

18.7 PCB

IMPORTANT:
When replacing the board refer to instructions supplied with the spare part.

18.7.1 Main PCB

- Remove the 24V and 230V connections.
- Remove the rear panel (2).
- Ease back the two PCB retaining clips (3) and withdraw the PCB from the retaining lugs.
- Remove the electrical connections to the PCB (appliance interface cable).
- When refitting the rear panel, ensure the leads are not trapped.
18.7.2 2A Fuse Rating

- For access, refer to chapter "Main PCB".
- The fuse is located at top right hand side of the PCB, see chapter "Electrical connection >Wiring diagram".

18.7.3 User interface PCB

Key
1 User interface
2 Retaining slots
3 User interface PCB
4 Retainings clips
5 Control Panel

- Remove the user interface (1) easing back the two retaining slots (2).
- Ease back the two PCB retaining clips (4) and withdraw the PCB from the retaining lugs.
- Remove the electrical connections to the PCB.
- When refitting the user interface, ensure the leads are not trapped.

18.7.4 Mains supply cable

**DANGER:**
The main supply cable must be replaced by a qualified and competent electrician.

- If the main supply cable is damaged, replace it refering to the chapter "Electrical connection".

19 Spare parts

In order to guarantee the safe and prolonged life of the product, manufacturers genuine spare parts must be used.

**IMPORTANT:**
This appliance displays a CE Mark of conformity. Only use the manufacturer’s genuine, new spare parts.

- Ensure that spare parts are correctly mounted in the right position and direction. After fitting any spare part or servicing, the appliance must be tested for its safe operation.
When ordering spare parts, contact Glow-worm’s own service organisation.

Please quote the name of the appliance and serial number, to be found on the data label. If ordering from British Gas also quote the G.C. number of the part.

IMPORTANT. With regards to the Manual Handling Operations, 1992 Regulations, the following lift operation exceeds the recommended weight for a one man lift.

General recommendations when handling

Ensure co-ordinated movements during lift. Avoid upper body/top heavy bending - do not lean forward/sideways. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip. Always use assistance if required.

Removal of carton from delivery van

Recommend 2 person lift or 1 person with use of sack truck. If 1 person is performing lift, straddle the load, tilt and place carton into position on truck. Recommend secure appliance onto truck with suitable straps. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. If 2 persons performing lift, ensure co-ordinated movements during lift. Always use assistance if required.

Carriage of carton from point of delivery to point of installation – ground floor.

Recommend 2 person lift or 1 person with use of sack truck. If 1 person is performing lift, straddle the load, tilt and place carton into position on truck. Recommend secure appliance onto truck with suitable straps. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. If 2 persons performing lift, ensure co-ordinated movements during lift. Clear the route before attempting the lift. If removing boiler from truck straddle the load and tilt forwards to facilitate secure grip. Ensure safe lifting techniques are used – keep back straight – bend using legs. Do not twist – reposition feet instead. Take care to avoid trip hazards, slippery or wet surfaces and when climbing steps and stairs. Always use assistance if required.

Carriage of carton from point of delivery to point of installation – first or higher floor, cellar.

Recommend 2-person lift or 1 person with use of sack truck. If 1 person is performing lift, straddle the load, tilt and place carton into position on truck. Recommend secure appliance onto truck with suitable straps. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. If 2 persons performing lift, ensure co-ordinated movements during lift. Avoid upper body/top heavy bending - do not lean forward/sideways. Clear the route before attempting the lift. If removing boiler from truck straddle the load and tilt forwards to facilitate secure grip. Ensure safe lifting techniques are used – keep back straight – bend using legs. Do not twist – reposition feet instead. Take care to avoid trip hazards, slippery or wet surfaces and when climbing steps and stairs. Always use assistance if required.

Carriage of carton from point of delivery to point of installation – roof space.

Recommend 2-person lift. Ensure co-ordinated movements during lift. Avoid upper body/top heavy bending - do not lean forward/sideways. Clear the route before attempting the lift. Take care to avoid trip hazards, slippery or wet surfaces and when climbing steps and stairs. When transferring appliance into roofspace, recommend 1 person to be in roofspace to receive the appliance and other person to be below to pass up and support appliance. Ensure safe lifting techniques are used – keep back straight – bend using legs. Keep load as close to body as possible. Always use assistance if required. It is assumed safe access, flooring and adequate lighting are provided in the roof space. It is recommended a risk assessment of the roof space area be carried out before moving the appliance into the area to take into account access, stability of flooring, lighting and other factors, and appropriate measures taken.

Unpacking of appliance from carton.

Recommend 2 persons unpack appliance from carton. Always keep working area clear. Cut the carton straps, lift carton up and slide over polystyrene end packs. Remove top polystyrene pack with fittings.

Positioning of Appliance for Final Installation – no obstructions.

Recommend 2 persons lift appliance to position into place. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, onto worktop if practicable. Ensure stable balance achieved and lift upwards to position in place on bracket. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Ensure co-ordinated movements to ensure equal spread of weight of load. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – above worktop, foreseeable obstructions etc.

Recommend 2 persons lift appliance to position into place. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, onto worktop if practicable. Ensure stable balance achieved and lift upwards to position in place on bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Avoid upper body/top heavy bending - do not lean forward/sideways. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – within compartment etc. restricting installation.

Recommend 2 persons lift appliance to position into place, space permitting. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, onto worktop if practicable. Ensure stable balance achieved and lift upwards to drop into place onto bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. If 1 person positioning onto bracket obtain firm grip supporting base of boiler. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – in roof space restricting installation.

Recommend 2 persons lift appliance to position into place, space permitting. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, ensure stable balance achieved and lift upwards to drop into place onto bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. If 1 person positioning onto bracket recommend obtain firm grip supporting base of boiler. Ensure safe lifting techniques are used - keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – above worktop, foreseeable obstructions etc.

Recommend 2 persons lift appliance to position into place. Fit bracket securely onto wall before lifting appliance into position. Obtain firm grip on front and sides of appliance, lift upwards, onto worktop if practicable. Ensure stable balance achieved and lift upwards to position in place on bracket. If 2 persons positioning onto bracket obtain firm grip at front and sides/base of boiler. Ensure co-ordinated movements during 2 person lifts to ensure equal spread of weight of load. Ensure safe lifting techniques are used – keep back straight – bend using legs - when lifting load from floor level. Do not twist – reposition feet instead. Keep boiler as close as possible to body throughout lift to minimise strain on back. Avoid upper body/top heavy bending - do not lean forward/sideways. Always use assistance if required. Recommend wear suitable cut resistant gloves with good grip to protect against sharp edges and ensure good grip when handling appliance.

Positioning of Appliance for Final Installation – within compartment etc. restricting installation.

THE MARK OF QUALITY FOR THE INSTALLATION, COMMISSIONING AND SERVICING OF DOMESTIC HEATING AND HOT WATER SYSTEMS
# COMMISSIONING CHECKLIST
## GAS BOILER SYSTEM

This Commissioning Checklist is to be completed in full by the competent person who commissioned the boiler as a means of demonstrating compliance with the appropriate Building Regulations and then handed to the customer to keep for future reference.

Failure to install and commission this equipment to the manufacturer’s instructions will invalidate the warranty but does not affect statutory rights.

Customer Name ___________________________ Telephone Number ___________________________
Address ___________________________ ___________________________
Commissioned by (print name) ___________________________ Engineer ID Number ___________________________
Company Name ___________________________ Telephone Number ___________________________
Company Address ___________________________ ___________________________
Commissioning Date ___________________________

To be completed by the customer on receipt of a Building Regulations Compliance Certificate *:
Building Regulations Notification Number (if applicable)

## CONTROLS

<td></td>
<td></td>
</tr>
</tbody>
</table>

## CONDENSING BOILERS ONLY

The condensate drain has been installed in accordance with the manufacturer’s instructions and/or BS5546/BS6798

## ALL INSTALLATIONS

If required by the manufacturer, record the following:

<table>
<thead>
<tr>
<th>CO₂</th>
<th>%</th>
<th>OR</th>
<th>CO</th>
<th>ppm</th>
<th>OR</th>
<th>CO₂/CO₂ Ratio</th>
</tr>
</thead>
</table>

The heating and hot water system complies with the appropriate Building Regulations

The boiler and associated products have been installed and commissioned in accordance with the manufacturer’s instructions

The operation of the boiler and system controls have been demonstrated to and understood by the customer

The manufacturer’s literature, including Benchmark Checklist and Service Record, has been explained and left with the customer

Commissioning Engineer’s Signature ___________________________

Customer’s Signature ___________________________

(To confirm satisfactory demonstration and receipt of manufacturer’s literature)

*Installations in England and Wales must be notified to Local Authority Building Control (LABC) either directly or through a Competent Person’s Scheme. A Building Regulations Compliance Certificate will then be issued to the customer.

**SERVICE INTERVAL RECORD**

It is recommended that your heating system is serviced regularly and that you complete the appropriate Service Interval Record Below.

**Service Provider.** Before completing the appropriate Service Interval Record below, please ensure you have carried out the service as described in the boiler manufacturer’s instructions. Always use the manufacturer’s specified spare part when replacing all controls.
