IDEAL ELAN 2
NF 230, NF 240, NF 250, NF 260 & NF 280
Wall Mounted, Fanned, Balanced Flue Gas Boilers.
Installation & Servicing.

CAUTION: To avoid the possibility of injury during the installation, servicing or cleaning of this appliance, care should be taken when handling edges of sheet steel components.

IMPORTANT: The appliances are for use with NATURAL GAS ONLY.

GENERAL

INTRODUCTION

The Ideal Elan 2 NF 230, NF 240, NF 250, NF 260 and NF 280 are fully automatically controlled, wall mounted, low water content, balanced flue, fanned gas boilers. They are range rated to provide central heating outputs of 4.4 kW (15 000 Btu/h) to 23.4 kW (80 000 Btu/h).

The boiler casing is of white enamelled mild steel, with a fascia of satinised white glass. The control pod, also of white enamelled mild steel, has fixed sides and a removable bottom panel.

The glass fascia slides upwards to reveal the boiler thermostat (in the control box mounted on the gas valve) and the programmer (if fitted).

A Programmer Kit, which fits neatly within the casing, is available as an optional extra. Separate fitting instructions are included with this kit.

The boilers are supplied with a standard flue kit suitable for rear or side outlet applications from 114mm (4 1/2 in.) to 406 mm (16 in.).

Up to 3 optional Flue Extension Duct Kits allowing up to 3 m (118 in.), rear or side outlet, are available.

A Vertex Flue Kit, for vertical flue connection is available as an optional extra.

A 90g Flue Elbow Kit, is also available.

The boilers are suitable for connection to fully pumped, open vented or sealed water systems. Adequate arrangements for completely draining the system by provision of drain cocks, MUST be provided in the installation pipework.

It is the law that all gas appliances are installed by competent persons (e.g. CCF/I, identified by ), in accordance with the above Regulations. Failure to install appliances correctly could lead to prosecution. It is in your own interest, and that of safety, to ensure that the law is complied with.

The installation of the boiler MUST also be in accordance with the current I.E.E. Wiring Regulations, the Local Building Regulations, Building Standards (Scotland), the bye laws of the Local Water Undertaking and any relevant requirements of the Local Authority.

Detailed recommendations are contained in the following British Standard Codes of Practice.

BS 6891 Low pressure installation pipes.
BS 6798 Installation of gas fired hot water boilers of rated input not exceeding 60kW.
BS 5449 Forced circulation hot water systems.
BS 5546 Installation of gas hot water supplied for domestic purposes (2nd Family Gases).
BS 5440:1 Flues for gas appliances of rated input not exceeding 60kW.
BS 5440:2 Ventilation for gas appliances of rated input not exceeding 60kW.

Manufacturers’ notes must not be taken in any way as overriding statutory obligations.

IMPORTANT: These appliances are certificated by the British Standards Institution for safety and performance. It is, therefore, important that no external control devices, e.g. flue dampers, windmills etc. are directly connected in

INTRODUCTION - GAS SUPPLY

Any direct connection of a control device not approved by Caradon Heating Ltd. could invalidate the B.S.I. Certification and the normal appliance warranty. It could also infringe the Gas Safety Regulations and the above regulations.

LOCATION OF BOILER

The boiler MUST be installed on a flat and vertical non-combustible wall, capable of adequately supporting the weight of the boiler and any ancillary equipment.

THE BOILER IS NOT SUITABLE FOR EXTERNAL INSTALLATION

IMPORTANT NOTICE. If the boiler is to be fitted in a timber framed building it should be fitted in accordance, with the British Gas publication 'Guide for Gas Installations in Timber Frame Housing', Reference DM2. If in doubt advice must be sought from the local Gas Region of British Gas.

The boiler may be installed in any room or internal space, although particular attention is drawn to the requirements of the current I.E.E. Wiring Regulation and, in Scotland, the electrical provisions of the Building Regulations applicable in Scotland with respect to the installation of the boiler in a room or internal space containing a bath or shower.

Where a room sealed appliance is installed in a room containing a bath or shower then the appliance and any electrical switch or appliance control utilising mains electricity should be so situated that it cannot be touched by a person using the bath or shower.

Where installation will be in an unusual location, special procedures may be necessary and BS. 6798 gives detailed guidance on this aspect.

A compartment used to enclose the boiler MUST be designed and constructed specially for this purpose. An existing cupboard or compartment may be used, provided it is modified for the purpose. Details of essential features of cupboards / compartment design, including airing cupboards installation are given in BS. 6798.

In siting the boiler, the following limitations MUST be observed:

1. The position selected for installation MUST allow adequate space for servicing in front of the boiler and for air circulation around the boiler. For the minimum clearances required for safety and subsequent service, see the Wall Mounting Template and Frame 4. In addition sufficient space may be required to allow lifting access on to the wall mounting plate.
2. This position MUST also permit the provision of a satisfactory flue termination.

GAS SUPPLY

The Local Gas Region should be consulted, at the installation planning stage, in order to establish the availability of an adequate supply of gas.

An existing service pipe must NOT be used without prior consultation with the Local gas region.

A gas meter can only be connected by the Local Gas Region, or by a local Gas Region Contractor. An existing meter should be checked, preferably by the Gas Region, to ensure the meter is adequate to deal with the rate of gas supply required.

Installation pipes should be fitted in accordance with BS. 6891. Pipework from the meter to the boiler MUST be of an adequate size. Do NOT use pipes of a smaller size than the Conventional Gas connection.
GENERAL

FLUE INSTALLATION

The flue MUST be installed in accordance with the recommendations of BS 5440: 1.

The following notes are intended for general guidance.

1. The boiler MUST be installed so that the terminal is exposed to the external air.
2. It is important that the position of the terminal allows the free passage of air across it at all times.
3. The minimum acceptable spacing from the terminal to obstructions and ventilation openings are specified in Table 3.
4. Where the lowest part of the terminal is fitted less than 2 m (6.6 ft) above a balcony, above ground or above a flat roof to which people have access then the terminal MUST be protected by a purpose designed guard.
Terminal guards are available from:
Quinnell, Barret & Quinnell Ltd.,
884 Old Kent Road, London, SE15  (Model 304),
Telephone No. 071 6391357,
and from,
Tower Flue Components Ltd.,
Vale Rise, Tonbridge, Kent, TN9 1TB   (Model K1),
Telephone No. 0732 351555.
Ensure that the guard is fitted centrally.
5. Where the terminal is fitted within 850 mm (34 in.) of a plastic or painted gutter, or 450 mm (18 in.) of painted eaves then an aluminium shield at least 750 mm (30 in.) long should be fitted to the underside of the gutter or painted surface.
6. The air inlet / products outlet duct and the terminal of the boiler MUST NOT be closer than 25 mm (1 in.) to combustible material. Detailed recommendations on the protection of combustible material are given in BS. 5440:1 1990.
7. If the terminal is fitted less than 2 m (6 ft. 6 in.) above a balcony, above ground or above a flat roof then the minimum spacing in Table 3, No.s 2, 3, 5 and 6 would be 75 mm in order to allow a terminal guard to be fitted.
8. Where it is essential that the terminal wall plate is fitted, i.e. wall thicknesses over 610 mm (24 in.) or with an inaccurately cut hole, the minimum spacing in Table 3, No.s 2, 3, 5 and 6 would be 60 mm in order to allow the terminal wall plate to be fitted.

IMPORTANT. It is absolutely ESSENTIAL to ensure, in practice, that products of combustion discharging from the terminal cannot re-enter the building or any other adjacent building through ventilators, windows, doors, other sources of natural air infiltration, or forced ventilation / air conditioning.
If this should occur, the appliance MUST be turned OFF immediately and the Local Gas Region consulted.

TERMINAL

The flue terminal assembly can be adapted to accommodate various wall thicknesses and flue lengths. Refer to Frame 3.

AIR SUPPLY

Detailed recommendations for air supply are given in BS. 5440: 2. The following notes are for general guidance:

1. It is NOT necessary to have a purpose provided air vent in the common internal space in which the boiler is installed.

FLUE INSTALLATION - AIR SUPPLY

2. If the boiler is to be installed in a cupboard or compartment, permanent air vents are required (for cooling purposes) in the cupboard/ compartment, at both high and low levels. The air vents must either communicate with room/internal space, or be direct to outside air. The minimum effective areas of the permanent air vents, required in the cupboard/ compartment, are specified as follows and are related to maximum rated heat input.

3. Both air vents MUST communicate with the same room or internal space, or MUST be on the same wall to outside air.

4. In siting the air vents care must be taken to avoid the freezing of pipework.

Refer to Tables 4, 5, 6, 7 & 8 for details of air vent position and sizing.

AIR SUPPLY - ELECTRICAL SUPPLY

The hot water cylinder and ancillary pipework, not forming part of the useful heating surface, should be lagged to prevent heat loss and any possible freezing, particularly where pipes run through roof spaces and ventilated under floor spaces.

Draining taps MUST be located in accessible positions, which permit the draining of the whole system, including the boiler and hot water storage vessel.

Draining taps should be at least 1/2 in. nominal size and be in accordance with BS. 2879.

The hydraulic resistances of the boilers, at MAXIMUM OUTPUT with an 11°C (20°F) temperature differential, are shown in Table 9.

ELECTRICAL SUPPLY

Wiring external to the appliance MUST be in accordance with the current I.E.E. Wiring Regulations and any Local Regulations which apply.

The boiler is supplied for 240 V ~ 50 Hz

Single Phase

Fuse Rating is 3 A

The method of connection to the mains electricity supply MUST facilitate complete electrical isolation of the boiler, preferably by the use of a fused, unswitched three pin plug and a shuttered socket outlet, both complying with the requirements of BS. 1363.

Alternatively, a fused double pole switch, having at least a 3 mm (1/8 in.) contact separation in both poles and servicing only the boiler, may be used.

The point of connection to the mains should be readily accessible and adjacent to the boiler, except that for bathroom installations, the point of connection to the mains MUST be situated outside of the bathroom.

Note. Where a room sealed appliance is installed in a room containing a bath or shower then the appliance and any electrical switch or appliance control utilising mains electricity should be so situated that it cannot be touched by a person using the bath or shower.

WATER CIRCULATION SYSTEM

The boiler must NOT be used for direct hot water supply.

The boiler is suitable for connection to fully pumped open vented or sealed water central heating systems or central heating combined with indirect domestic hot water systems.

The central heating system should be in accordance with BS. 6798 and in addition, for Smallbore and Microbore systems, BS. 5449

The domestic hot water system, if applicable, should be in accordance with relevant recommendations to BS. 5546.

Copper tubing to BS. 2871:1 is recommended for water carrying pipework.

The hot water storage cylinder MUST be of the indirect type and should be, preferably, manufactured of copper.

Singly insulated cylinders are not recommended and
1 UNPACKING  The boiler is supplied fully assembled in one pack 'A', together with a standard flue assembly for lengths up to 406 mm (16 in.), rear or side flue outlet, in pack 'B'. Optional extras, if ordered, (Programmer Kit, Extension Duct Kit 'D', Vertex Flue Kit and 90° Flue Elbow Kit) are available in separate boxes. Unpack and check the contents.

PACK 'A' CONTENTS  Also contained in Pack 'A'; the Hardware Pack (listed opposite), these installation & Servicing Instructions and the User's Instructions.

PACK 'B' CONTENTS  Also contained in Pack 'B'; No.8 x 6 mm self tappers, 9 off; length of adhesive tape, 1 off; duct cutting support rings, 2 off (cardboard - retain for later use); rectangular washer, 3 off.

15. Flue outlet elbow.
16. Flue outlet sealing plate.
3 WALL MOUNTING AND FLUE LENGTH

IMPORTANT: The boiler MUST be installed in a vertical position.

Dimension 'X' - wall thickness
Dimension 'Y' - wall thickness plus boiler spacing.

Flue Kits.
Pack B - supplied as standard.
Pack D - optional extension kit for side & rear flue outlet. Refer to Frames 27 and 28 (up to 3 lengths).

4 BOILER DIMENSIONS & CLEARANCES

The following minimum clearances must be maintained for operation and servicing. Additional space will be required for installation depending upon site conditions. In addition a minimum of 450 mm MUST be available at the front of the boiler for servicing.

Side and Rear Flue Installations.
1. Provided that the flue hole is cut accurately, e.g. with a core drill the flue can be installed from inside but for flue lengths greater than the width/depth of the boiler then the space in which the boiler is to be installed must be at least equal to the flue length plus the length of the terminal grill, (inside installation up to 610 mm wall thickness only).
2. If a core boring tool is to be used from inside the building, the space in which the boiler is to be installed must be at least wide enough to accommodate the tool.

Side Flue Installations ONLY.
3. Once the boiler has been installed, the clearance on the non-flue side may be reduced to 10 mm.

5 BOILER CASING REMOVAL

To install the boiler, the casing MUST be removed.
1. Release the top captive screw.
2. Slide the glass fascia upwards until it locates in the retaining catch.
3. Remove the 2 securing screws, slide the bottom panel forward slightly, & then sideways to remove from the casing.
4. Release the 2 bottom captive screws and lift the casing off the boiler. Place the casing safely to one side, taking care not to damage the glass fascia panel. (Slide the glass panel down in the casing for safe keeping.)
6 FLUE ASSEMBLY - Exploded View

1. An optional duct extension kit is required for wall thicknesses greater than 406 mm (16 in.). Refer to Frames 27 and 28.
2. When cutting the ducts, always use the cardboard support rings provided.

Legend
1. Flue outlet elbow.
2. Flue blanking plates.
3. Locking collar.
4. Air duct gasket.
5. Wall mounting plate.
6. Duct assembly.
7. Terminal assembly.
8. Terminal wall plate.
9. Terminal fixing screws.
10. Collar fixing screws.
11. Sliding collar.
12. Sealing disc.

7 WALL MOUNTING TEMPLATE

1. Discard both sections 'B' of the template.
2. Tape the template into the selected position.
3. Ensure squareness by hanging a plumb line as shown.
4. Mark onto the wall the 4 mounting plate screw positions and the lower fixing screw positions.
5. Mark onto the wall the position of the flue duct.
   Note: Mark the centre of the hole as well as the circumference.
6. Remove the template from the wall.

8 PREPARING THE WALL

IMPORTANT: Ensure that, during the cutting operation, masonry falling outside of the building does not cause damage or personal injury.

1. Cut the flue hole (preferably with a 5 in. core boring tool) ensuring that the hole is square to the wall. If the hole has been quite accurately cut with a drill, then making good the wall faces is not essential as seals are provided at both ends of the flue. However, both wall faces immediately around the cut hole should be flat, make good if necessary. For less accurate holes make good to approximately 125 mm diameter at the two wall faces. If the flue hole is longer than 810 mm this must be done from the outside for the outer face, as access to outside is needed to fit the terminal plate anyway.

2. Measure and note the wall thickness 'X'.
3. Drill the 5 fixing holes with an 8 mm (5/16 in.) masonry drill.
4. Insert the plastic plugs provided.
5. Locate the No. 10 x 2 in. screws in the wall mounting plate top fixing holes and screw home to within 6 mm (1/4 in.) of the wall surface.

Note. If the terminal is to be fitted within 25 to 40 mm of a corner or vertical pipe (refer to Table 3) then the hole MUST be accurately cut and the rubber weather seal trimmed around the groove provided. The terminal wall plate need not be fitted.

5 in. diameter flue hole

SECTION SHOWING WALL THICKNESS, 'X'.

Note. Check all of the hole positions BEFORE drilling.
### 9 CUTTING THE DUCT ASSEMBLY
**WALL THICKNESSES OF 114 TO 216 mm ONLY.**

1. Separate the duct assembly.

2. Push the sliding collar to the end of the duct and measure off dimension 'X' (wall thickness).

3. Cut to length 'X', using the cardboard duct rings for support. **Note:** Cut the inner flue tube 6mm (1/4 in.) longer than the outer air tubes.

4. Always cut 102 mm (4 in.) off the terminal section.

5. Remove the cardboard support rings.

6. Re-assemble the terminal, aligning the seams.

### 10 JOINING THE DUCT ASSEMBLY
**WALL THICKNESSES UP TO 406 mm ONLY.**

1. Push the sliding collar to the boiler end of the assembly.

2. Set the assembly to length, wall thickness 'X' plus 50 mm (2 in.).

3. Using the sliding collar as a template at the duct join, mark the positions of the 3 fixing screws. **Note:** If the duct join is too close to the rubber weather seal to permit access for drilling, mark the hole positions at the mid-point of the duct.

4. Slide the collar back to the boiler end of the duct and mark the positions for a further 3 fixing screws.

5. Drill the 6 fixing holes using a 3.2 mm. drill, insert the self tapping screws in order to fix the collar in position and lock the duct assembly. **DO NOT DRILL THE INNER FLUE DUCT.**

6. Seal the air duct joint with the aluminium tape provided in the Hardware Pack.

**FOR WALL THICKNESSES ABOVE 406 mm, REFER TO FRAMES 27 & 28 - FLUE EXTENSION DUCTS.**

### 11 FITTING THE FLUE ASSEMBLY
**FROM EITHER THE INSIDE OR OUTSIDE OF THE BUILDING.**

1. Push the assembly through the wall.

2. Locate the wall mounting plate over the flue assembly. Engage the flue duct collar lugs with the wall mounting plate slots & rotate the flue assembly to lock. Proceed to Frame 12.

**Weather seal. Apply soap solution to ease fitting.**

**FROM OUTSIDE OF THE BUILDING.**

1. Fit the wall mounting plate (Frame 12) - but do not drive the No. 10 screws home.

2. Push the assembly through the wall. Engage the collar lugs with the wall mounting plate slots & rotate the flue assembly to lock.

3. Drive home the No. 10 wall mounting plate screws.

**PROCEED NOW TO STEP 3 OF FRAME 12**

### 12 WALL MOUNTING PLATE

1. Engage the plate on the top fixing screws. Flue is shown locked in position.

2. Locate two No. 10 x 2 in. wood screws in the remaining fixing holes and drive home all four screws.

3. Check with a spirit level that the plate is vertical.

3. Align the holes in the sliding collar flange with the 3 cut-outs in the wall plate. Insert 3 of the self-tappers and rectangular washers to retain the assembly.

### 13 TERMINAL WALL PLATE

This plate is provided to allow the neat concealment and full compression of the rubber seal. If the flue hole and flue ducts have been accurately cut and the outside wall face is flat then its use is not essential except that this plate must be used on wall thicknesses over 610 mm (24 in.).

1. Position the terminal wall plate over the terminal.

2. Drill 4 fixing holes with an 6 mm (4/16 in.) masonry drill.

3. Insert the four plastic plugs provided.

4. Secure the plate with four of the No. 10 x 2in. screws provided.

**Note:** If the terminal is less than 2 m (6.6 ft.) above ground level, an approved terminal guard should be fitted. Refer to Page 4.
14 MOUNTING THE BOILER

1. Disconnect the pressure sensing tube from the fan.
2. Disconnect the fan electrical leads and unclip the harness from the fan mounting plate.
3. Remove the four screws, each with two washers, securing the fan assembly to the top of the collector hood.
4. Lift off the fan assembly and place carefully to one side.
5. Remove the flue pipe connector from its transit position and discard it (for use with side flue only).

Note. Always take care when handling the fan, to preserve the balance of the impeller.

![Image of boiler assembly]

Wall mounting plate.
The studs fit into slots in the boiler back panel and the air duct spigot enters the flue outlet hole in the back panel.

LIFT HERE

6. Lift the boiler onto the wall mounting plate - as shown.

LIFT HERE

Have ready to hand the sealing discs and wing nuts supplied in the Hardware Pack.

7. Fit a sealing disc over each stud and secure with a wing nut.

Note. Before fully tightening the wing nuts, check the boiler alignment using a spirit level, and adjust as necessary with the jacking screw. Refer to Frame 3.

8. Locate the No. 10 x 2 in. screw in the boiler lower fixing hole on the jacking screw and secure to the wall.

DO NOT USE THE BURNER / CONTROLS ASSEMBLY FOR LIFTING.

15 SEALING THE BOILER AND FLUE

1. Stretch the rubber gasket over the air duct spigot.
2. Fit the locking collar as shown and rotate it to engage with the locking slots in the flue assembly.
3. Fold the locking handle as shown.
4. Slacken the two nuts at fan outlet joint 'B' on the fan outlet elbow.
5. Refit the fan plate assembly, fully engaging the fan outlet spigot into the flue pipe.
6. Secure the fan assembly to the collector hood with the four screws previously removed.

![Image of sealing assembly]

Air duct spigot
Locking handle

Locking slots
Rubber gasket
Locking collar

7. Retighten the two extended nuts at joint 'B'.
8. Reconnect the electrical leads and the pressure sensing tube to the fan.

APPLIANCES FITTED WITH A REAR OUTLET FLUE: PROCEED DIRECTLY TO FRAME 20.
16 FLUE ASSEMBLY - Exploded View
1. An optional duct extension kit is required for lengths of dimension "Y" (wall thickness plus boiler/wall spacing) greater than 406 mm (16 in.). Refer to Frames 3 and 27.
2. When cutting the ducts, always use the card/ board support rings provided.

LEGEND
1. Flue blanking plate.
2. Wall mounting plate.
3. Locking collar.
4. Air duct gasket.
5. Terminal mounting plate.
6. Duct assembly.
7. Terminal assembly.
8. Terminal wall plate.
9. Terminal fixing screw, 3 off.
10. Collar fixing screw, 3 off.
11. Sliding collar.
12. Flue pipe connector.
13. Flue outlet elbow.
14. Sealing disc and wing nut. (2 off)

17 WALL MOUNTING TEMPLATE
1. Separate the templates.
2. Tape both templates into the selected position locating template "B" via an extended centre line as shown.
3. Ensure squareness by hanging a plumb line as shown.
4. Mark onto the wall the mounting plate screw positions and the lower fixing screw position.
5. Mark onto the wall the 4 terminal mounting plate screw positions.
6. Mark onto the wall the position of the flue duct hole.
   Note: Mark the centre of the hole as well as the circumference.
7. Remove both templates from the wall.

18 PREPARING THE WALL
IMPORTANT. Ensure that during the cutting operation, masonry tailing outside of the building does not cause damage or personal injury.
1. Cut the flue hole (preferably using a 5 in. core boring tool), ensuring that the hole is square to the wall. If the hole has been quite accurately cut will a drill then making good the wall faces is not essential - as seals are provided at both ends of the flue. However, both wall faces immediately around the cut hole should be flat; make good if necessary. For less accurate holes make good to approximately 125 mm diameter at the two wall faces. For holes longer than 610 mm this must be done from outside for the outer face as access to outside is needed to fit the terminal wall plate anyway.
2. Measure the wall thickness "X" and calculate dimension "Y" (i.e. Boiler spacing plus "X"). Refer to frame 3.
3. Drill the all 9 fixing holes with an 8 mm (5/32 in.) masonry drill and insert the plastic plugs provided.
4. Locate two No. 10 x 2 in. screws in the terminal mounting plate top fixing holes and screw home to within 6mm (1/4 in.) of wall surface.
   Note: If the terminal is to be fixed 25 to 40 mm from a corner or vertical pipe (refer to Table 3) the hole must be accurately cut and the rubber weather seal trimmed around the groove provided. The terminal wall plate need not be fitted.
19 CUTTING THE DUCT ASSEMBLY
FLUE LENGTHS OF 114 TO 216 mm ONLY.

1. Separate the duct assembly.
2. Push the sliding collar to the end of the duct and measure off dimension "Y" (wall thickness plus boiler spacing).
3. Cut to length "Y", using the cardboard duct rings for support. Note: Cut the inner flue tube 6 mm (1/4 in.) longer than the outer air tubes.
4. Always cut 102 mm (4 in.) off the terminal section.
5. Remove the cardboard support rings.
6. Re-assemble the terminal, aligning the seams.

20 JOINING THE DUCT ASSEMBLY
FLUE LENGTHS UP TO 406 mm ONLY.

1. Push the sliding collar to the boiler end of the assembly.
2. Set the assembly to length, dimension "Y" plus 50 mm (2 in.).
3. Using the sliding collar as a template at the duct join, mark the positions of the 3 fixing screws (A). Note: If the duct join is too close to the rubber weather seal to permit access for drilling, mark the hole positions at the mid-point of the duct.
4. Set the collar to the required position, i.e. dimension "X" (wall thickness) plus 50 mm (2 in.) and mark the positions for a further 3 fixing screws (B).

21 FITTING THE FLUE ASSEMBLY
FROM INSIDE OF THE BUILDING.

1. Push the flue duct assembly through the wall.
2. Take the terminal mounting plate and stick the sealing tape provided to the reverse side of the plate. Locate the plate over the projecting flue duct assembly and engage the flue duct collar lugs with the terminal mounting plate slots. Rotate the flue assembly to lock. Continue the installation procedure from Note 2 of Frame 22.

Weather seal. Apply soap solution to ease fitting.

FROM OUTSIDE OF THE BUILDING ONLY.

1. Fit the terminal mounting plate as detailed in Notes 1 to 4 of Frame 22 - but do not drive the No. 10 x 2.5 in. fixing screws fully home until the flue duct assembly is engaged.
2. From outside of the building, push the assembly through the wall. Engage the flue duct collar lugs with the terminal mounting plate slots and rotate the flue assembly to lock.
3. Drive home the No. 10 x 2.5 in. fixing screws.
4. Make good between the plate and the corner of the wall.

FOR FLUE LENGTHS ABOVE 406 mm, REFER TO FRAMES 27 & 28 - FLUE EXTENSION DUCTS.

22 TERMINAL MOUNTING PLATE

1. Stick the sealing tape, provided, to the reverse side of the plate.
2. Engage the plate on the top two fixing screws.
3. Locate two No. 10 x 2.5 in. screws in the bottom fixing holes and drive home all four screws.
4. Check with a spirit level that the plate is vertical.
5. Make good between the plate and the corner of the wall.
6. Align the holes in the sliding collar flange with the 3 slots in the terminal wall plate. Insert 3 of the self tapping screws and rectangular washers, provided, to retain the assembly. Refer to the detail in Frame 22.
1. Sealing the Boiler and Flue:
   (a) Stretch the rubber gasket over the air duct spigot.
   (b) Fit the collar as shown and rotate to engage with the flue assembly locking slots.
   (c) Fold the locking handle as shown.

2. Fan Outlet Arrangement.
   The fan outlet is supplied for rear outlet installation.
   Re-arrange the outlet elbow to suit either a left hand side or a right hand side outlet as shown below.

   LEFT HAND SIDE OUTLET
   REAR OUTLET
   RIGHT HAND SIDE OUTLET

   Note. When altering the arrangement of the fan outlet elbow, for either side, slacken the extended nuts at joint 'B - B' to help alignment when re-fitting the fan assembly.
   LEFT HAND SIDE OUTLET: Disconnect at joint 'A - A' and rotate through 180°
   RIGHT HAND SIDE OUTLET: Disconnect at joint 'A - A', 'B - B' & rotate both halves through 180°

3. Fan Assembly Refitting.
   (a) Cut the side outlet flue pipe connector to the required length, given in the Table below.

<table>
<thead>
<tr>
<th>Boiler size</th>
<th>Dimension 'A'</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Left hand flue</td>
</tr>
<tr>
<td>NF 230 to NF 260</td>
<td>No cutting required</td>
</tr>
<tr>
<td>NF 280</td>
<td>200 mm (8 in.)</td>
</tr>
</tbody>
</table>

   (b) Fit the flue pipe connector onto the fan outlet elbow.
   (c) Refit the fan assembly onto the collector hood, fully engaging the flue pipe connector into the flue pipe. Secure the assembly with the four screws previously removed. Re-tighten the extended nuts at joint 'B - B' on the flue outlet elbow.
   (d) Reconnect the electrical leads and the pressure sensing tube to the fan.

PROCEED TO FRAME 29
27 PACK 'D' CONTENTS AND GENERAL ARRANGEMENT OF THE FLUE DUCTS

PACK 'D' FLUE EXTENSION DUCT KIT CONTENTS. Unpack the Kit and check the contents.

- Length of adhesive tape.
- Wall plug.
- No. 8 x 1/4 in. self tapping screws, 4 off.
- No. 10 x 2 in. wood screw, 1 off.

Extension duct, 860 mm (33 1/2 in.) long.
Support bracket.

FLUE LENGTHS UP TO 3 m. USE A MAXIMUM OF THREE KITS ONLY.

GENERAL ARRANGEMENT. Note. Side flue configuration shown.
1. A MAXIMUM OF THREE KITS ONLY may be used together.
2. Always cut the extension ducts at the plain ends only.
3. Ensure that there is at least a 25 mm (1 in.) overlap at each joint.
4. For flue lengths of less than 457 mm (18 in.), ensure that the collar is positioned on an air duct (outer).
5. Flue extensions of greater length than 1 m (39 in.) should be supported with the bracket provided.
6. Tape all air duct connections.
7. Always align the seams when re-assembling the ducts.

28 FITTING THE KIT

IMPORTANT. Read in conjunction with Frame 27.

1. Separate the flue duct assembly.
2. Insert the appropriate extension duct(s) with the plain end(s) toward the terminal.
3. Re-assemble the terminal and the duct assemblies.
4. Push the sliding collar back to the boiler end of the duct, or to its intended position.
   5. Set the assembly to length, i.e. Dimension 'X' (wall thickness) plus 50 mm (2 in.) or Dimension 'Y' (wall thickness and boiler spacing) plus 50 mm (2 in.).
   6. Using the sliding collar as a template at the joins of any ducts mark the positions the fixing screws (3 screws for each joint).
5. Drill at the markings with a 3.2 mm. drill.
6. Lock the assembly in position with the self tapping screws provided.
7. Drill through the holes of the collar into the air duct with a 3.2 mm. drill and lock the sliding collar into position with 3 of the self tapping screws provided.
   Note. If the flue duct assembly locking screws restrict the sliding collar then use the collar locking screws to lock the whole assembly.

APPLIANCES FITTED WITH A REAR OUTLET FLUE: PLEASE REFER TO FRAME 11 (PAGE 9).
APPLIANCES FITTED WITH A SIDE OUTLET FLUE: PLEASE REFER TO FRAME 21 (PAGE 12).
29. GAS CONNECTION

1. A MINIMUM working gas pressure of 20 mbar (8 in.wg) MUST be available at the boiler inlet.

2. Extend a gas supply pipe NOT LESS THAN 15 mm O.D. to the boiler and connect to the gas service cock situated at the bottom left hand side of the boiler. Note. If the pipe run from the meter to the boiler is greater than 3 m (10 ft.), it is recommended that 22 mm O.D. pipe is used.

3. To facilitate connection, it is recommended that the gas service cock is not removed from the gas control valve. A 1/2 in. BSP x 15 mm connector prefitted with a short stub connection should be screwed into the cock using a suitable sealant. Ensure that the gas supply pipe does not foul the boiler casing when fitted.

IMPORTANT. The gas service cock contains a non-metallic seal, so must not be overheated when making capillary connections.

4. Test the gas installation for soundness and purge in accordance with BS. 6691.

30. WATER CONNECTIONS

1. Connect the system flow and return pipework to the two water connections at the top of the boiler.

Note. When the required output exceeds 16.1kW (55 000 Btu/hr) 28mm (1in.) flow and return pipes should be used, both to and from the boiler. On the NF 260 boiler only connect to the boiler in 22mm (7/8 in.) pipe and increase to 28 mm (1 in.) as soon as is practicable.

2. Ensure that all valves are open, fill and vent the system and check for water soundness. Note:- This appliance is NOT suitable for use with a direct hot water cylinder.

IDEAL ELAN NF 260 ONLY

When venting the heat exchanger using the manual or vent on the flow header, protect the electrical controls with a waterproof sheet or similar.

31. OPEN VENT SYSTEM REQUIREMENTS

The system should be vented directly off the boiler FLOW pipe, as close to the boiler as possible. The cold feed entry should be inverted and MUST be positioned between the pump and the vent, and not more than 150 mm (6 in.) away from the vent connection.

Notes. Combined feed and vent pipes may also be fitted.

There should be a minimum height - 450 mm (18 in.) of open vent above the cistern water level. If this is not possible then refer to Frame 32. The vertical distance between the highest point of the system and the feed / expansion cistern water level MUST not be less than 450mm (18 in.).

The pump must be fitted on the flow side of the boiler.

A suitable pump is a domestic circulator capable of providing an 11°C (20°F) temperature differential (e.g. Grundfos UPS 15/50 or equivalent). The vertical distance between the pump and the feed / expansion cistern MUST comply with the pump Manufacturer's minimum requirements to avoid cavitation. Should these conditions not apply, either lower the pump position or raise the cistern above the minimum requirement specified by Caradon Heating Ltd. Isolation valve should be fitted as close to the pump as possible.
### 32 LOW HEAD INSTALLATIONS - OPEN VENT

The Ideal Elan 2 NF range of boilers can be installed in low head situations by fitting a surge arrester in the expansion pipe.

The following conditions MUST be observed:
1. The surge arrester must be at least 42 mm diameter x 150 mm long.
2. The cistern water level must be at least 200 mm above the highest point of the system.
3. The height of water in the surge arrester must be at least 75 mm.
4. The vent connection must NOT be made directly off the top of the boiler.

Note. The pump manufacturer’s minimum requirements must be complied with.

### 33 SCHEMATIC PIPEWORK AND BY-PASS ADJUSTMENT - OPEN VENT

**WATER FLOW RATE AND PRESSURE LOSS**

</tbody>
</table>

1. The temperature differential across the boiler MUST NOT be more than 11°C.
2. When the NF 280 (with output above 16.1 kW [55 000 Btu/h]) and NF 280 units are used, 22mm (1in.) flow and return pipes MUST be used - both to and from the boiler.
3. The control system used with the boiler MUST provide a load in circuit with the boiler of at least 10% of the boiler output whenever the boiler fires. In order to achieve this load it may be necessary to provide ‘uncontrolled’ radiator(s) which cannot be manually turned off by the user.
4. A by-pass MUST be fitted as far from the boiler as possible, consisting of the following:
   a. 15 mm pipe not more than 1 metre long for boilers up to 50 000 Btu/h output.
   b. 22 mm pipe for boilers of over 50 000 Btu/h output.

The by-pass should incorporate a balancing valve which CANNOT be adjusted by the householder.

5. The circulating pump used should have adequate performance to give a maximum temperature differential across the boiler of 9°C when the by-pass and the ‘uncontrolled’ radiator(s) (when fitted) are closed, with either the heating or the domestic hot water controls calling for heat.

**BY-PASS ADJUSTMENT**

6. With the heating circuit OPEN and the by-pass and “uncontrolled” radiator(s) (if fitted) CLOSED, set the pump to give a maximum of 9°C differential across the boiler and system. The system should be at full temperature for this operation and this is a convenient point to balance the system flows.
7. Open the valve on the ‘uncontrolled’ radiator(s) (if fitted) and set its temperature differential to approximately 10°C.
8. Open the by-pass until the differential across the boiler is 11°C.
9. Check that the water flow through the boiler is adequate when the heating controls are satisfied and the domestic hot water controls are calling for heat.

**Thermostatic Radiator Valves**

Caradon Heating Ltd. support the recommendations made in BS. 5449 and by leading manufacturers of domestic heating controls that heating systems utilising the full thermostatic radiator valve control of temperature in individual rooms should also be fitted with a room thermostat controlling the temperature in a space served by radiators not fitted with such a valve.

Such an arrangement will provide for a potentially more efficient control of the environment and will also avoid the continuous running of the circulation pump during prolonged heating ‘ON’ periods - thus saving electrical energy. It is therefore strongly recommended that, when thermostatic radiator valves are used, space heating temperature control over a living / dining area or a hallway having a heating requirement of at least 10 % of the boiler heat output is achieved using a room thermostat whilst other rooms are individually controlled by thermostatic radiator valves. If a room thermostat is not fitted as described above then it is recommended that the system includes a thermostatic valve to maintain a difference of 10 to 20°C of the boiler heat output under design conditions.

![Diagram](image-url)
1. General.
(a) The installation must comply with the requirements of BS. 6798 and BS. 5449.
(b) The installation should be designed to work with flow temperatures of up to 82°C.
(c) All components of the system, including the heat exchanger of the indirect cylinder, must be suitable for a working pressure of 3 bar (45 lb.ft. / in²) and temperature of 110°C. Care should be taken in making all connections so that the risk of leakage is minimised.

2. Safety Valve.
A spring loaded safety valve complying with the relevant requirements of BS. 6759 must be fitted in the flow pipe as close to the boiler as possible and with no intervening valve or restriction. The valve should have the following features:
(a) A non-adjustable pre-set lift pressure not exceeding 3 bar (45 lb.ft. / in²).
(b) A manual testing device.
(c) Provision for connection of a discharge pipe.
   The valve or discharge pipe should be positioned such that the discharge of water or steam cannot create a hazard to the occupants of the premises, or cause damage to electrical components and wiring.

3. Pressure Gauge.
A pressure gauge covering at least the range 0 - 4 bar (0 - 60 lb.ft. / in²) must be fitted to the system. The gauge should be easily seen from the fitting point and should preferably be connected at the same point as the expansion vessel.

4. Expansion Vessel.
(a) A diaphragm type expansion vessel must be connected at a point close to the inlet side of the pump, the connecting pipe being not less than 15 mm (.5 in. nominal) size and not incorporating valves of any sort.
(b) The vessel capacity must be adequate to accept the expansion of the system water when heated to 110°C (230°F).
(c) The charge pressure must not be less than the static water head above the vessel. The pressure attained in the system when heated to 110°C (230°F) should be at least 0.35 bar (5 lb.ft. / in²) less than the lift pressure of the safety valve.
   For guidance on vessel sizing refer to the Table in Frame 35.
   For further details refer to BS. 5449, BS. 7074-1 & the British Gas Corporation publication - Material and Installation Specifications for Domestic Central Heating & Hot Water'.

5. Cylinder.
The cylinder must be either of the indirect coil type or a direct cylinder fitted with an immersion calorifier, which is suitable for operating on a gauge pressure of 0.35 bar (5 lb.ft. / in²) in excess of the safety valve setting. Single feed indirect cylinders are not suitable for sealed systems.

6. Make-up Water.
Provision must be made for replacing water loss from the system either:
(a) From a manually filled make-up vessel with a readily visible water level. The vessel should be mounted at least 150 mm (6 in.) above the highest point of the system, and be connected through a non-return valve to the system, fitted at least 300 mm (12 in.) below the make-up vessel on the return side of the domestic hot water cylinder or radiators.
(b) Where access to a make-up vessel would be difficult, by pre-pressurisation of the system. Refer to 'Filling'.

7. Mains Connection.
There must be no direct connection to the mains water supply or to the water storage tank supplying domestic water, even through a non-return valve, without the approval of the Local Water Authority.
**35 SEAMED SYSTEM REQUIREMENTS**

The system may be filled by one of the following methods:

(a) Through a cistern, used for no other purposes, via a ball valve permanently connected directly to a service pipe and/or a cold water distributing pipe.

The static head available from the cistern should be adequate to provide the desired initial system design pressure. The cold feed pipe from the cistern should include a non-return valve & a stop valve with an automatic air vent connected between them, the stop valve being located between the system & the automatic air vent. The stop valve may remain open during normal operation of the system if automatic water make-up is required.

(b) Through a self-contained unit comprising a cistern, pressure booster pump if required, and if necessary, an automatic pressure reducing valve and flow restrictor. The cistern should be supplied through a temporary connection from a service pipe or cold water distributing pipe.

This unit may remain permanently connected to the heating system to provide limited automatic water make-up. Where the temporary connection is supplied from a service pipe or distributing pipe which also supplies other ‘draw-off’ points at a lower level then a double check valve shall be installed upstream of the draw off point.

**Sizing procedure for expansion vessels:** The volume of the expansion vessel (litres) fitted to a sealed system shall not be less than that given by the table below multiplied by a factor of 0.8 (for flow temperatures of less than 88°C).

**36 ELECTRICAL CONNECTIONS**

**WARNING.** This appliance MUST be efficiently earthed.

A mains supply of 240V ~ 50 Hz is required.

All external controls & wiring MUST be suitable for mains voltage. Wiring should be 3-core PVC insulated cable, NOT LESS than 0.75 mm² (24 x 0.2 mm) and to BS. 6500, Table 16. Wiring external to the boiler MUST be in accordance with the current I.E.E. Wiring Regulations and any Local Regulations.

The supply connection may be made via a removable plug to an unswitched shuttered socket/outlet, preferably adjacent to the boiler; & should such a plug be used for connection to the mains, it must be of the 3-pin type-wired as shown, fused at 3A & comply with the requirements of BS. 1363. Alternatively, a fused double-pole switch, having a 3mm contact separation in both poles, connecting only the boiler & its external controls may be used.
37 INTERNAL WIRING  
Note: If the Programmer Kit is to be fitted, refer to the instructions provided with the kit and Frame 38.

A Pictorial Wiring diagram is shown in Frame 39 & a wiring diagram is included in the Lighting instructions label on the casing bottom panel.

1. Remove the 2 control box lid fixing screws and disengage the lid retention hooks. Remove the lid.
2. Route the mains cable through the strain relief mounted on the pressure switch bracket.
3. Lift the terminal strip from its control box retention slots.
4. Wire the live, neutral and earth into the terminal strip, ensuring that the lengths of the current carrying conductors are shorter than the earth conductor so that if the cable slips in its anchorage the current carrying conductors become taut before the earth conductor.
5. Slide the terminal strip back into its retention slot and push the cable into the control box R.H. side rear cable clamp.
6. Tighten the main cable relief on the pressure switch bracket.
7. Replace the control box lid and retain with the 2 screws previously removed. Note. Ensure that no basic insulation is accessible outside of the control box.

FLOW WIRING DIAGRAM

38 EXTERNAL WIRING

External wiring MUST be in accordance with the current I.E.E. Wiring Regulations.

The wiring diagrams illustrated in Frames 40 to 42 cover the systems most likely to be used with this appliance.

For wiring external controls to the Ideal Elein 2 NF boiler, reference should be made to the systems wiring diagram supplied by the relevant Manufacturer in conjunction with the wiring diagrams shown in Frame 39.

Difficulty in wiring should not arise, providing the following directions are observed:

1. Controls that switch the system ON & OFF, e.g. a time switch, MUST be wired in series, in the live mains lead to the boiler.
2. Controls that over-ride an ON / OFF control, e.g. a frost thermostat, MUST be wired into the mains lead in parallel with the controls to be over-ridden. Refer to Frame 43.

3. If a proprietary system is used, follow the instructions supplied by the Manufacturers.
4. The pump must always be wired in 'parallel' with the boiler.
5. SYSTEM DESIGNS FEATURING CONTROLS OR WIRING ARRANGEMENTS WHICH ALLOW THE BOILER TO FIRE WHEN THERE IS NO PUMPED CIRCULATION TAKING PLACE SHOULD NOT BE FITTED.

Advice on required modifications to wiring may be obtained from the component Manufacturers.

Notes:

1. Connections between a frost thermostat and the time control should be made without disturbing other wiring.
2. A frost thermostat should be sited in a cool place in the house, but where it can sense heat from the system.
ONE VALVE IN HEATING CIRCUIT - Pumped only

1. Some earth wires are omitted for clarity. Ensure proper earth continuity when wiring.
2. Numbering of thermostat terminals applies ONLY to the Manufacturer mentioned.
3. Switchmaster valve also has grey and orange wires, but the GREY wire (not the orange), must be connected to the incoming supply.

---

TWO SPRING CLOSED VALVES - Pumped only

1. Some earth wires are omitted for clarity. Ensure proper earth continuity when wiring.
2. This is a fully controlled system - set the boiler thermostat to HIGH.
3. Numbering of thermostat terminals applies ONLY to the Manufacturer mentioned.
4. Switchmaster Autozone also has grey and orange wires, but the GREY (not the orange) wire must be connected to the incoming live supply.

**43 FROST PROTECTION**

1. The frost thermostat should be wired to the programmer as shown, without disturbing the existing wiring.
2. The frost thermostat should be sited in a cool place in the house, but where it can sense heat from the system.
3. The occupier should be advised that, during frosty weather, the system should be turned OFF at the programmer switches ONLY. All other controls should be left in the normal running position.

**TYPICAL PROGRAMMER**

- DOUBLE POLE FROST THERMOSTAT

**44 COMMISSIONING AND TESTING**

(a) Electrical Installation

1. Checks to ensure electrical safety should be carried out by a competent person.
2. ALWAYS carry out the preliminary electrical system checks i.e. earth continuity, polarity, resistance to earth and short circuit using a suitable test meter.

(b) Gas Installation

1. The whole of the gas installation, including the meter, should be inspected & tested for soundness & purged in accordance with the recommendations of BS. 6891.
2. Purge air from the gas installation by loosening the four extended nuts securing the gas service cock and purging until gas is smelled.
3. Retighten the nuts and test for gas soundness.

**WARNING.** Whilst affecting the required gas soundness test & purging air from the gas installation, open all windows & doors, extinguish naked lights & DO NOT SMOKE.

**45 INITIAL LIGHTING**

**BOILER CONTROLS**

- **E** Fascia retention catch.
- **F** Gas service cock.
- **G** Inlet pressure test nipple.
- **H** Main burner pressure adjuster.
- **I** Main burner pressure test nipple.

**Legend**

- **A** Sightglass.
- **B** Thermostat knob.
- **C** Thermostat.
- **D** Overheat thermostat reset button.

1. Check that the electricity supply is OFF.
2. Check that the gas service cock (F) is ON and the boiler thermostat switch (C) is OFF.
3. Slacken the screw in the burner pressure test nipple (I) and connect a gas pressure gauge via a flexible tube.
4. Switch the electricity supply ON and check that all external controls are calling for heat.
5. Set the boiler thermostat knob (B) to position '6' and the thermostat switch (C) to ON. The pilot solenoid valve should open and the intermittent spark commence - continuing until the pilot is established. The main burner will then light.

**FITTING THE BOILER CASING**

**IMPORTANT.** This appliance MUST NOT be operated with the casing removed.

- Lift the boiler casing with the glass fascia in the down position up to the boiler assembly & secure with the top two captive screws.
- Slide the fascia up until it locates in the retaining catch.
- Secure the bottom two captive screws.

**The casing MUST seat correctly and compress the sealing strip to make an airtight joint. If the side clearance is limited then this may be checked by ensuring that the top and bottom edges of the casing are correctly located.**

Check that the pilot flame envelops the ignition/detection electrode. If the pilot flame appears incorrect then refer to Frame 8 'Servicing'. **Note.** The pilot flame is factory set and no adjustment is possible.

6. Test for gas soundness around ALL boiler gas components, particularly valve & manifold flanges, using leak detection fluid.
7. Set the boiler thermostat switch (C) to OFF and switch OFF the electricity supply.
8. If the boiler output is to be set to MID or MINIMUM, affix the appropriate indicator label to the Data Plate, located on the bottom R.H. side of the back panel.
46 INITIAL LIGHTING

Continued from Frame 45.

1. Switch the electricity supply ON.
2. Set the boiler thermostat knob (B) to position '6' and the thermostat switch (C) to ON and the fan will start.
3. Once the pilot is established the main gas will come on. Check that the main burner cross lights smoothly.
   If this sequence does not occur then refer to the 'Fault Finding' section.
4. Operate the boiler for 10 minutes to stabilise the burner temperature.
5. The boiler is pre-set at the factory to its highest nominal rating, but can be range rated to suit the system design requirements. Refer to Table 2 on page 2.
   Turn the adjusting screw (H) clockwise to decrease the pressure.
6. Set the boiler thermostat switch (C) to OFF.
7. Remove the pressure gauge and tube. Retighten the sealing screw in the pressure test nipple. Ensure a gas tight seal is made.
8. Re-fit the casing bottom panel.

47 GENERAL CHECKS

Make the following checks for correct operation:

1. Set the boiler thermostat knob to position '6' and operate the thermostat ON/OFF switch. Check that the main burner lights and extinguishes in response.
2. The correct operation of ANY programmer and all other system controls should be proved.
   Operate each control separately and check that the main burner or circulating pump, as the case may be, responds.
3. Check that the casing is sealed correctly and compressing the sealing strip all around the casing.
4. Water Circulation System
   (a) With the system HOT, examine all water connections for soundness.
   (b) With the system still hot, turn off the gas, water and electricity supplies to the boiler and drain down in order to complete the flushing process.
   (c) Re-fill and vent the system, clear all air locks and again check for water soundness.
   (d) Balance the system and set the by-pass.

5. Finally set the controls to the User's requirements and slide the glass fascia down into the closed position.
   • If an optional Programmer Kit is fitted then refer to the instructions supplied with the kit.
   • The temperatures quoted below are approximate and vary between installations.

WARNING. The boiler MUST NOT be operated with the casing removed.

48 HANDING OVER

After completing the installation and commissioning of the system, then the Installer should hand over to the Householder by the following actions:

1. Hand the User's Instructions to the Householder and explain his or her responsibilities under the Gas Safety (Installation and Use) Regulations 1984.
2. Draw attention to the Lighting Instruction label affixed to the casing front and visible through the observation window in the glass fascia when in the raised position.
3. Explain and demonstrate the lighting and shutting down procedures.
4. The operation of the boiler and the use and adjustment of ALL system controls should be fully explained to the Householder, to ensure the greatest possible fuel economy, consistent with household requirements of both heating and hot water consumption.

Advise the User of the precautions necessary to prevent damage to the system and to the building, in the event of the system remaining inoperative during frosty conditions.

6. Explain the function and the use of the boiler thermostat and external controls.

6. Explain the function of the boiler over-heat thermostat and emphasise that if cut-out persists, the boiler should be turned off and the local Heating Installer consulted.
7. Explain and demonstrate the function of time and temperature controls, radiator valves, etc for the economic use of the system.
8. If any Programmer Kit is fitted, then draw attention to the Programmer Kit User's instructions and hand them to the Householder.
9. Stress the importance of regular servicing by the Local Gas Region or by a qualified Heating Engineer and that a comprehensive service should be carried out AT LEAST ONCE A YEAR.
1 SCHEDULE
To ensure the continued safe and efficient operation of the appliance, it is recommended that it is checked at regular intervals and serviced as necessary. The frequency of servicing will depend upon the installation condition and usage, but should be carried out at least annually. It is the law that any service work must be carried out by a competent person.

(a) Light the boiler and carry out a pre-service check, noting any operational faults.
(b) Clean the main burner.
(c) Clean the heat exchanger.
(d) Clean the main and pilot injectors.
(e) Check that the flue terminal is unobstructed and that the flue system is sealed correctly.
(f) If the appliance has been installed in a compartment, check that the ventilation areas are clear.

The servicing procedures are covered more fully in Frames 2 to 8 and must be carried out in sequence.

WARNING. Always turn off the gas supply at the gas service cock and and switch off & disconnect the electricity supply to the appliance before servicing.

IMPORTANT. After completing the servicing or exchange of components always test for gas soundness and carry out functional checks as appropriate.

Note. In order to carry out either servicing or replacement of components, the boiler casing must be removed (Frame 2).

IMPORTANT. When work is complete the casing MUST be correctly refitted, ensuring that a good seal is made: Do NOT OPERATE THE BOILER IF THE CASING IS NOT FITTED.

2 BOILER CASING REMOVAL
1. Release the top two captive screws.
2. Slide the glass fascia upwards until it locates in the retaining catch.
3. Remove the two securing screws, slide the bottom panel forward slightly, and then sideways to remove from the casing.

4. Release the two bottom captive screws and lift the casing off the boiler. Place the casing safely to one side, taking care not to damage the glass fascia panel. Slide the glass panel down in the casing for safe keeping.

3 BURNER AND AIR BOX REMOVAL
1. Remove the wing nut securing the burner front support bracket. Remove the M5 pozi screws situated at the left hand, bottom rear of the burner & pull the burner downwards in order to disengage the retention tab. Remove the burner to a safe place for inspection & cleaning.

2. Remove the control box lid fixing screws. Pull the lid forwards and upwards to disengage the catches and remove the lid.
3. Pull the H.T. lead connection off the printed circuit board and pull the lead through the bottom panel grommet.

4. Remove the four screws retaining the air box / pilot assembly to the vertical manifold & remove the assembly.

4 CLEANING THE FAN ASSEMBLY
1. Disconnect the fan electrical leads and unclip the harness from the fan plate.
2. Disconnect the pressure sensing tube from the fan.
3. Remove the four screws, each with two washers, securing the fan assembly to the collector hood.
4. Slide the fan assembly clear of the boiler, disengaging the fan outlet elbow from the flue.
5. Remove the fan plate to check that the fan impeller runs freely.
   Clean with a soft brush or renew as necessary, refer to Frame 18

Note. Always take care when handling the fan, due to the balance of the impeller.

6. Check that the boiler air intake duct and air outlet is unobstructed.
5 CLEANING THE FLUEWAYS

1. Slacken the 4 wing nuts, disengage the tie rods and remove the flue collector hood.
2. Disconnect the pressure switch sensing pipe.
3. Place a plastic sheet, or similar, beneath the boiler and remove all loose deposits from the heat exchanger finned block and copper skirt using a suitable brush and / or clearing rod - brushing from above and below.

6 CLEANING THE BURNER AND PILOT ASSEMBLY

1. Brush off any deposits that may have fallen on to the burner head, ensuring the flame ports are un-obstructed and remove any debris that may have collected.
Note. Brushes with metallic bristles MUST NOT be used.
2. Remove the main burner injector and ensure there is no blockage or damage. Clean or renew as necessary.
3. Refit the injector using an approved joining compound sparingly.
4. Inspect the pilot burner & ignition / detection electrode. Ensure that they are clean & in good condition. Check that:
   (a) The pilot burner injector is not blocked or damaged. Refer to Frame 13 for removal details.
   (b) The pilot burner is clean and unobstructed.
   (c) The ignition/detection electrode is clean and undamaged.
   (d) The ignition / detection lead is in good condition.
   (e) The spark gap is correct (Frame 13). Clean or renew as necessary.
4. Refit the air box assembly and burner.
5. Refit the control box cover.
6. Turn on the gas supply at the gas service cock.
7. Re-connect the electricity supply.
8. Check the sightglass in the boiler casing. Clean or renew as necessary. Refer to Frame 10.
9. Refit the boiler casing.

IMPORTANT. When work is complete the casing MUST be correctly re-fitted. Ensure that a good seal is made.

7 RE-ASSEMBLY

Re-assemble the boiler in the following order:
1. Refit the flue collector hood - renewing any damaged or deteriorating sealing gasket.
   Note. Enter the horizontal tie rods, with the hooks vertical, through the collector hood slots and engage in the holes in the retention angle.
2. Reconnect the pressure switch sensing pipe.
3. Refit the fan mounting plate assembly, taking care to reconnect the pressure sensing pipe.
4. Refit the air box assembly and burner.
5. Refit the control box cover.
6. Turn on the gas supply at the gas service cock.
7. Re-connect the electricity supply.
8. Check the sightglass in the boiler casing. Clean or renew as necessary. Refer to Frame 10.
9. Refit the boiler casing.

IMPORTANT. When work is complete the casing MUST be correctly re-fitted. Ensure that a good seal is made.

8 GAS PRESSURE ADJUSTMENT

PILOT  Light the boiler and check that the pilot flame envelopes the ignition / detection electrode.

DETAIL OF SPARK GAP

- 3 to 5 mm

The pilot is factory set to maximum and no further adjustment is possible. However, if the pilot flame length is incorrect then remove and inspect the pilot injector. Refer to Frame 13. Relight in accordance with 'Initial Lighting'. Refer to Frame 46 'Installation'.

MAIN BURNER

After any servicing, reference should be made to Table 2 which quotes details of the rated output with the related burner setting pressure and the heat input. Any required adjustments should be made by using the pressure adjustment screw. Refer to 'Initial Lighting', Frame 46 'Installation'.

REPLACEMENT OF PARTS

9 GENERAL  When replacing any component:

1. Isolate the electricity supply.
2. Turn OFF the gas supply.
3. Remove the boiler casing. Refer to Frame 2.

IMPORTANT. When work is complete the casing MUST be correctly re-fitted, ensuring that a good seal is made.

Note. In order to assist fault finding the control box printed circuit board is fitted with 4 indicator lights which represent the following boiler conditions:

- Neon 11. Air pressure switch made.
- Neon 13. Mains electricity ON.
- Neon SG1. Flashes to indicate spark operation (stops after detection).

The boiler MUST NOT be operated if the casing is not fitted.
10 SIGHTGLASS REPLACEMENT
1. Refer to Frame 9.
2. Remove the glass fascia panel from the casing.
3. Unfasten the 2 nuts & washers & remove the assembly.
4. Fit the new sightglass and re-assemble as shown.
5. Retighten the two nuts to ensure an airtight seal. DO NOT OVERTIGHTEN.
6. Refit the fascia panel & replace the boiler casing (Frame 7).

11 CONTROL THERMOSTAT AND LEAD REPLACEMENT
Refer also to Frame 27 of 'Exploded Views' & Frame 39 'Installation'.
1. Refer to Frame 9.
2. Remove the control box lid fixing screws. Pull the lid forward and upward to disengage the catches and remove the lid.
3. Unclip and remove the front panel by lifting it upwards.
VIEW OF BOILER CONTROL BOX. Shown with cover removed.

12 OVERHEAT THERMOSTAT REPLACEMENT
1. Refer to Frame 9.
2. Remove the fan assembly. Refer to Frame 4.
3. Release the sensing head from the thermostat clamp.
4. Release the capillary from the top clip.
5. Unscrew and remove the heat shield.
6. Unscrew the two screws & remove the cover plate.
7. Remove the screw securing the overheat thermostat bracket to the pressure switch bracket and withdraw the complete assembly.
8. Remove the thermostat retaining nut and withdraw the thermostat.
9. Disconnect the 2 electrical leads & remove the thermostat from the boiler.
10. Fit the new thermostat and re-assemble in reverse order, ensuring that:
   (a) The thermostat capillary is routed between the side of the interpanel and the boiler back panel.
   (b) If a right hand side flue is fitted the thermostat capillary is clear of the side outlet flue pipe.
   (c) All excess capillary length is neatly coiled behind the pressure switch and clear of the casing.
   (d) The heat shield is replaced.
SERVICING

13 PILOT BURNER REPLACEMENT

1. Refer to Frame 9.
2. Remove the burner and air box assembly. Refer to Frame 3.
3. Remove the electrode retaining nut and withdraw the electrode.
4. Unscrew the central pilot fixing screw and lift the pilot clear of the pilot injector.

Note: The pilot injector may now be unscrewed if required, taking care not to lose the copper sealing washer.

5. Fit the new pilot burner assembly (and injector if necessary) and re-assemble in reverse order, ensuring that:
(a) The spark gap and pilot flame length are correct.
(b) The pilot injector copper sealing washer is re-fitted.
6. Check the pilot burner relationship to the main burner & the spark gap.
7. Replace the boiler casing. Refer to Frame 7.
8. Check the pilot length.
9. Check the pilot operation (cross lighting, etc.).

14 SPARK ELECTRODE AND LEAD REPLACEMENT

1. Refer to Frame 9.
2. Remove the burner and air box assembly. Refer to Frame 3.
3. Remove the electrode retaining nut.

4. Remove the spark electrode and integral lead.
5. Refit the new electrode and lead in reverse order.
6. Check the spark gap. Refer to frame 13.
7. Refit the burner.
8. Replace the boiler casing. Refer to Frame 7.
9. Check the pilot ignition.

15 MAIN BURNER AND MAIN BURNER INJECTOR REPLACEMENT

1. Refer to Frame 9.
2. Remove the wing nut retaining the front burner support bracket. Refer to Frame 3.
3. Remove the M5 pozi screw and washer, situated at the left hand bottom rear of the burner. Pull the burner downwards to disengage the retention tab and remove the burner.
4. Withdraw the burner from the boiler.
5. At this stage the main burner injector can be removed, checked, cleaned or replaced as required. Ensure that an approved jointing compound is used sparingly.
6. Transfer the front support bracket to the new burner.
7. Fit the new burner, ensuring that the retention tab is correctly located in the air box slot.
8. Refit M5 retaining screw and washer.
9. Refit the boiler casing. Refer to Frame 7.
10. Check the burner for cross-lighting and flame stability.
16. GAS CONTROL VALVE REPLACEMENT

Note. Also refer to Frame 26 of 'Exploded Views' for illustration of the procedure detailed below.

1. Refer to Frame 9.
2. Remove the control box as follows:
   (a) Remove the lid and unclip the front panel. Refer to Frame 11.
   (b) Pull off the connections at the printed circuit board. Refer to Frame 39 'Installation'.
   (c) Release the central fixing screw. Refer to Frame 27. Withdraw and suspend the control box.
   (d) Pull off the solenoid electrical connections and unscrew the earth lead at the gas control valve. Refer to Frame 39 'Installation'.
   (e) Suspend the control box from the incoming mains lead.
3. Remove the four M4 extended nuts securing the gas service cock to the gas valve.
4. Whilst supporting the gas control valve, remove the two screws retaining the manifold to the back panel.
6. Remove the four screws securing the manifold extension to the gas control valve and withdraw the valve.
7. Fit the new gas control valve, ensuring that:
   (a) The valve is fitted the correct way round (an arrow engraved on the back indicates the direction of flow).
   (b) The sealing gasket and ‘O’ ring supplied with the valve are correctly fitted.
8. Re-assemble in reverse order.
9. Replace the burner / air box assembly.
10. Replace the boiler casing. Refer to Frame 7.
11. Check the gas valve operation.

17. GAS CONTROL VALVE SOLENOID REPLACEMENT

1. Refer to Frame 9.
2. Remove the control box from the gas control valve. Refer to Frame 16.
3. Slide out the spring clip and remove the solenoid from the gas control valve.
4. Fit the new solenoid and re-assemble in reverse order.

18. FAN UNIT REPLACEMENT

1. Refer to Frame 9.
2. Disconnect the pressure sensing tube from the fan.
3. Disconnect the fan electrical leads and unclip the harness from the fan mounting plate.
4. Remove the four screws securing the fan assembly.
5. Slide the fan assembly clear of the boiler, disengaging the fan outlet elbow from the flue. Note. Always take care when handling the fan in order to preserve the balance of the impeller.
6. Transfer the pressure sensing pipe connector to the new fan.
   Pressure tube, see note 2.
   Fan assembly
   Collector hood
   Harness, see note 3.
7. Fit the new fan in reverse order.
8. Refit the boiler casing. Refer to Frame 7.
9. Check the boiler operation.

19. PRESSURE SWITCH REPLACEMENT

1. Refer to Frame 9.
2. Pull both of the sensing tubes off the pressure switch.
3. Remove the two screws securing the pressure switch to the back panel and withdraw the switch.
4. Remove the pressure switch cover by removing the fixing screw
5. Disconnect the three electrical leads.
6. Transfer the electrical connections to the new pressure switch. Yellow to No.2, red to No. 3 and violet to No. 1.
7. Fit the new pressure switch and re-assemble in reverse order. Ensure that the 2 rubber pipes are re-connected to the correct pressure switch connections (red pipe to lower connection marked with a red dot and white pipe to upper connection).
8. Refit the boiler casing. Refer to Frame 7.
9. Check the boiler operation.
20 CONTROL THERMOSTAT POTENTIOMETER REPLACEMENT
1. Refer to Frame 9.
2. Remove the control box lid. Refer to Frame 11.
3. Pull the potentiometer knob off the shaft & remove the back nut.
4. Unplug the potentiometer lead from the P.C.B. and withdraw the potentiometer from the control box.
5. Fit the new potentiometer and re-assemble in reverse order.
6. Refit the boiler casing. Refer to Frame 7.
7. Check the operation of the thermostat.

21 THERMOSTAT SWITCH REPLACEMENT
1. Refer to Frame 9.
2. Remove the control box lid. Refer to Frame 11.
3. Disconnect the two electrical leads from the switch.
4. Compress the retaining clips and prise the defective switch out of the front panel.
5. Fit the new switch and re-assemble in reverse order.
   Ensure that the switch is the correct way round, i.e. with the terminals towards the right, as shown. Polarity is immaterial.
6. Refit the boiler casing. Refer to Frame 7.
7. Check the operation of the thermostat.

22 AUTOMATIC IGNITION P.C.B. REPLACEMENT
1. Refer to Frame 9.
2. Remove the control box lid. Refer to Frame 11.
3. Disconnect the ignition / detection lead from the P.C.B.
4. Disconnect the four plug-in leads from the P.C.B.
5. Disconnect the two leads from the thermostat switch.
6. Slide the 5-way terminal strip from its housing and remove the three wires connected to the P.C.B.
7. Remove the control box central fixing screw (refer to Frame 27), draw the box forward and disconnect the four electrical leads from the gas valve solenoids.
8. Depress the two side retaining tabs and remove the P.C.B.
9. Fit the new P.C.B. and re-assemble in reverse order.
   Ensure that all electrical connections are correctly re-made. Refer to Frames 37 & 39 'Installation'.
10. Refit the boiler casing. Refer to Frame 7.
11. Check the ignition operation.
23 HEAT EXCHANGER REPLACEMENT

IMPORTANT. Before starting the removal procedure, protect the gas electrical controls with a waterproof sheet or plastic bag.

1. Refer to Frame 9.
2. Drain down the system and heat exchanger.
3. Remove the fan assembly. Refer to Frame 4.
4. Remove the burner and air box assembly. Refer to Frame 3.
5. Remove the flue collector hood. Refer to Frame 5.
6. Remove the control thermostat sensor and the overheat thermostat - complete with clamp. Refer to Frames 11 & 12.
7. Undo the nut and remove the retaining bracket.
8. Remove the two M5 screws in the top of the back panel and remove the pipe retention plates (90 NF only).
9. Disconnect the boiler flow & return fittings. Remove the back nuts.
10. Withdraw the heat exchanger - swinging forwards at the bottom, downwards and outwards.
11. Fit the new heat exchanger and re-assemble in reverse order.

24 CASING SEAL REPLACEMENT

1. Refer to Frame 9.

2. Remove the old seals from the channel in the casing, and press in the new seals (4 pieces).
3. Replace the boiler casing. Refer to Frame 7.

Note. Ensure that the casing is correctly sealed - compressing the sealing strip to make an airtight joint. If side clearances are limited, then this can be checked by ensuring that top and bottom edges of the casing are correctly located.

24 PROGRAMMER REPLACEMENT (if fitted)

1. Refer to Frame 9.

2. Remove the boiler control box lid and release the terminal strip from its slide retention. Disconnect the 'L', 'N' & ' ' connections from the terminal strip and release the cable clamps.
3. Remove the 2 screws retaining the programmer mounting bracket to the back panel mounting bracket.

4. Pull the programmer mounting bracket downward and forward in order to disengage the terminal strip connection.
5. Remove the 2 screws fastening the stainless steel lid to the programmer mounting bracket and remove the lid.
6. Slide the programmer upwards in order to clear the mounting bracket.
7. Remove the strain relief bush retaining the control box lead cable and remove the earth lead from the earth post.
8. Remove the 3 screws retaining the terminal strip to the programmer mounting bracket.
9. Remove the programmer, complete with its terminal strip and wiring harness.
10. Fit the new programmer, terminal strip and wiring harness in reverse order.
**26 BURNER ASSEMBLY - Exploded view**

**LEGEND**

1. Gas service cock.
2. "O" ring.
3. Gas control valve.
4. Gas control valve solenoid.
5. Sealing gaskets.
7. Air box & pilot assembly.
8. Main burner injector.
9. Main burner.
10. Burner manifold extension.
11. Control box.
12. Mains ON / OFF switch.
13. Thermostat knob.
14. Extended screws.
15. Spring clip.

**27 CONTROL BOX ASSEMBLY - Exploded view**

**LEGEND**

1. Control box front cover.
2. Thermostat potentiometer.
3. Printed circuit board retaining clips.
4. Printed circuit board.
5. Control box lid.
6. Control box lid fixing screws.
7. Mains input connector.
8. Strain relief bushes.
9. Central fixing screw.
10. Control box.
11. Mains ON / OFF switch.
12. Thermostat knob.
# SHORT LIST OF PARTS

## Ideal Elan 2 NF 230, NF 240, NF 250, NF 260 and NF 280 Gas Boilers.

The following list comprises parts commonly required as replacement components due to damage, expendability, or such that their failure or absence is likely to affect safety or performance. The list is extracted from the British Gas List of Parts, which contains all available spare parts.

Details of the British Gas Lists are held by Gas regions, CARADON Distributors and by Merchants.

When ordering spares please quote:
1. Boiler Model
2. Appliance G.C. Number
3. Description
4. Maker's Part Number
5. Quantity
